

# Common-sense Options for Regional Water Security

March 2015

The following presentation identifies some of the issues and several options for drinking water supplies in the Oceanside area of Vancouver Island

...Trevor Wicks ...  
**TRENTEC INNOVATIONS**  
Web. <http://www.innovationbc.com>

No credentials

2,000 years ago they designed  
and built efficient water  
systems using a lot of labor  
and common sense

Approximately the amount of water a family uses in one year

A growing population of 25,000 – 35,000 are depending on the watersheds and aquifers of the Oceanside Area

None of these drinking water sources are protected

Little Qualicum

40 + private utilities

Dashwood

Qualicum Beach

Epcor

7 RDN Systems

Parksville

Coombs

San Pareil

Nanoose

Errington

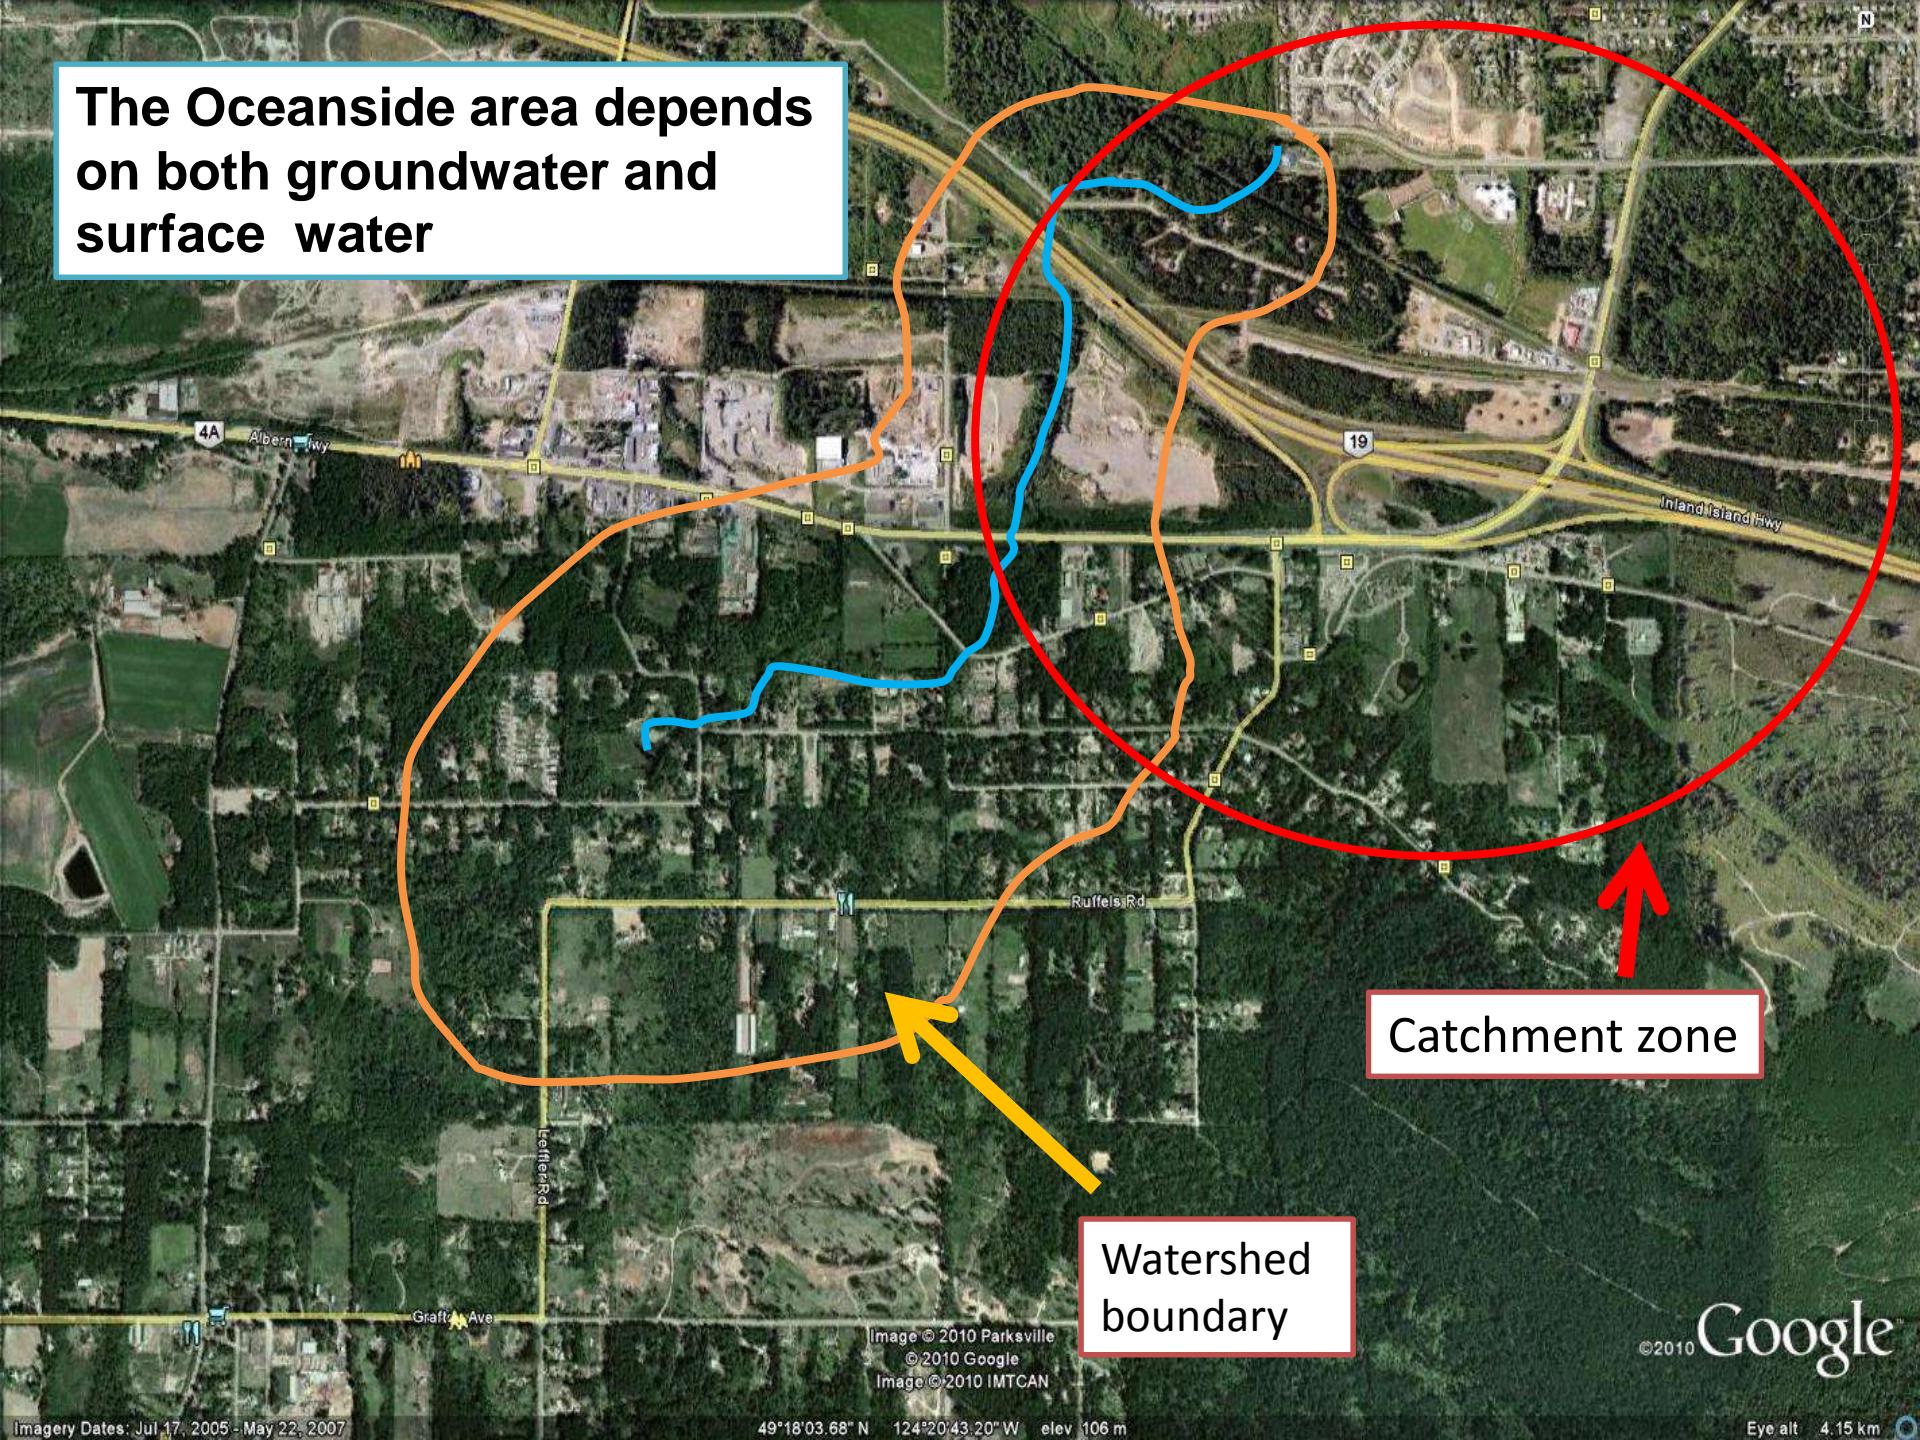

Fairwinds  
*The proposed new development will need a lot of water*

AWS

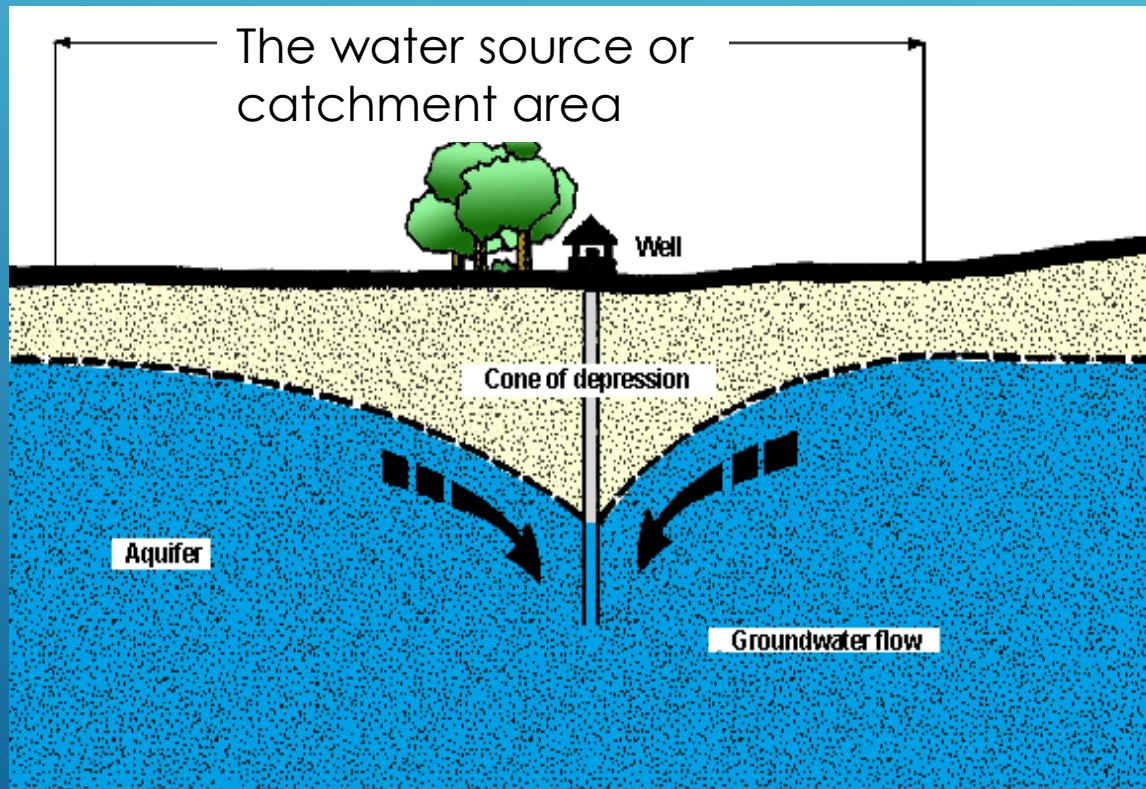

**All of our drinking water originates as precipitation, in the form of rain or snow.**

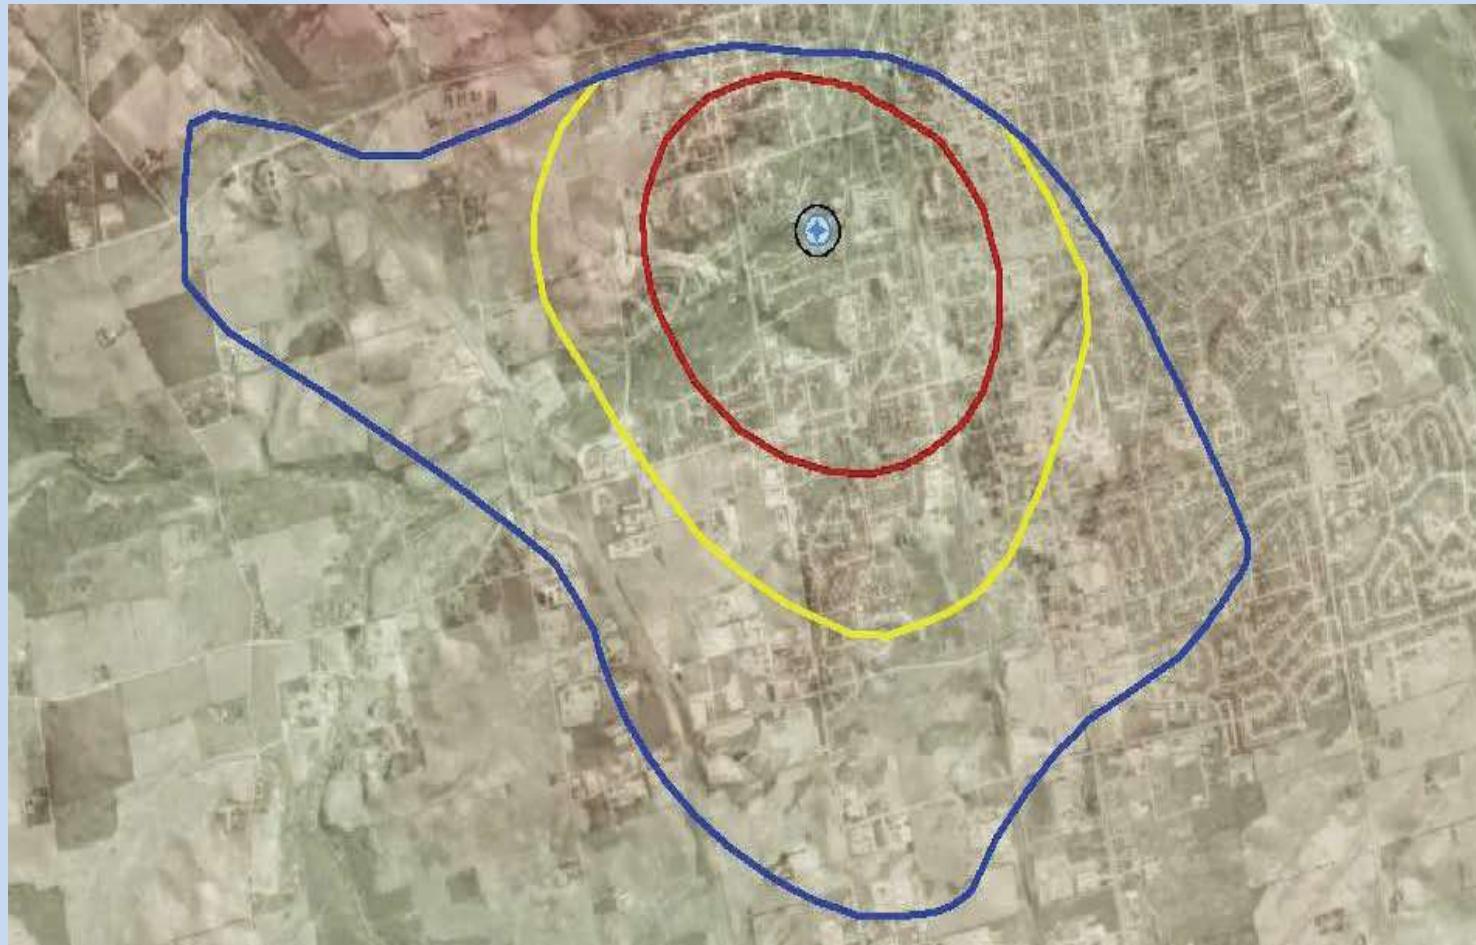

The Oceanside area depends  
on both groundwater and  
surface water

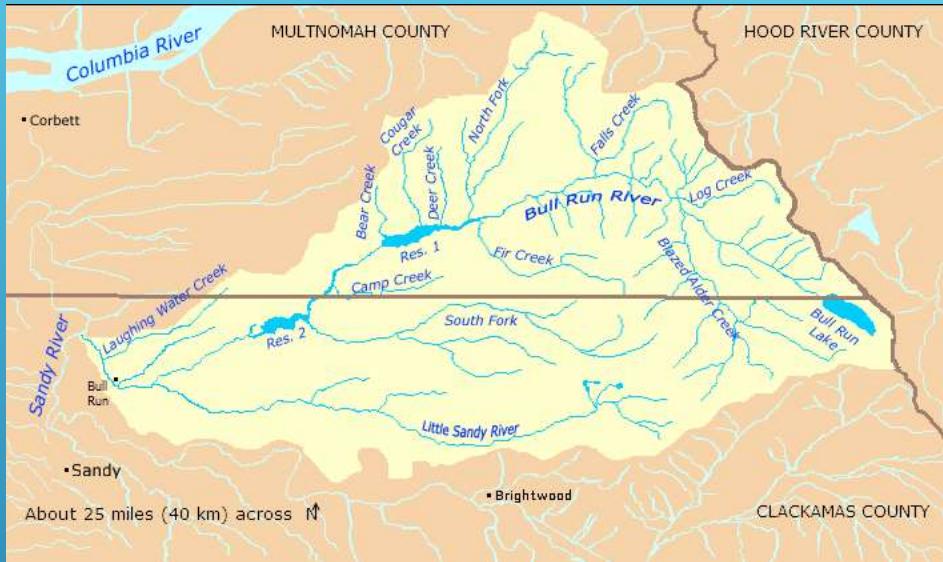

# Ground-water basics

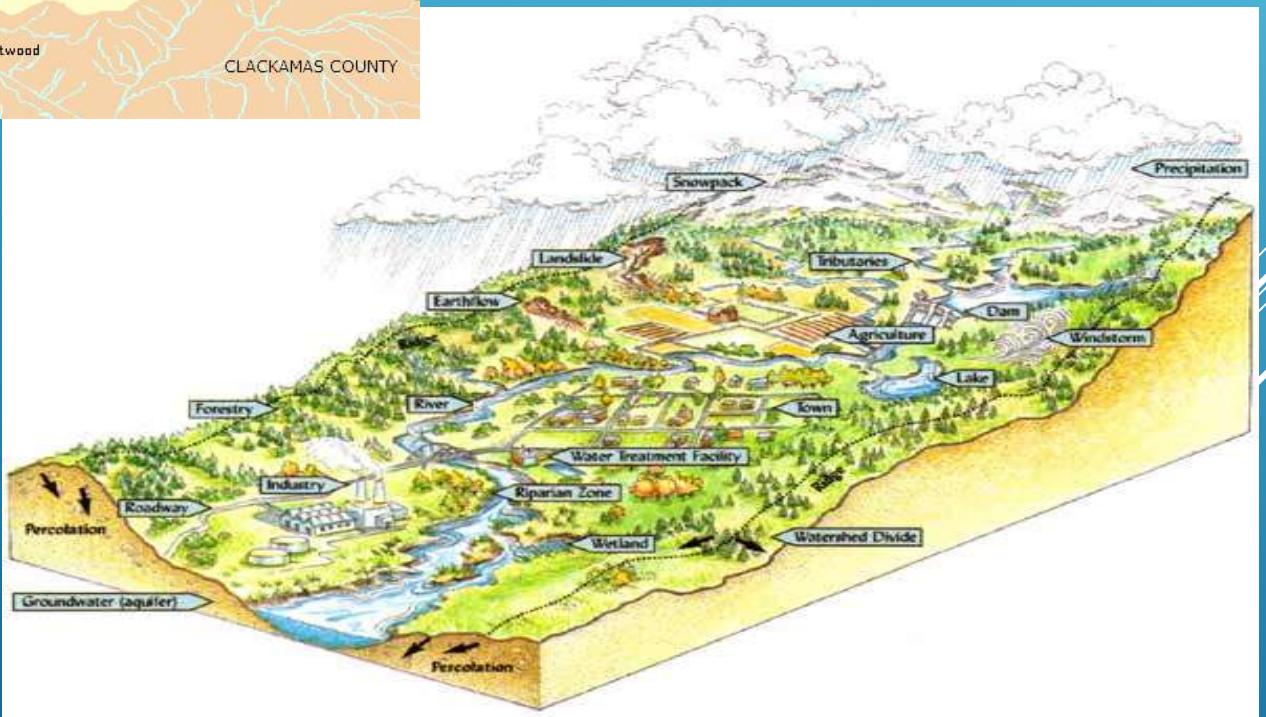

## Ground-water catchment zone or recharge area

# Surface Watershed

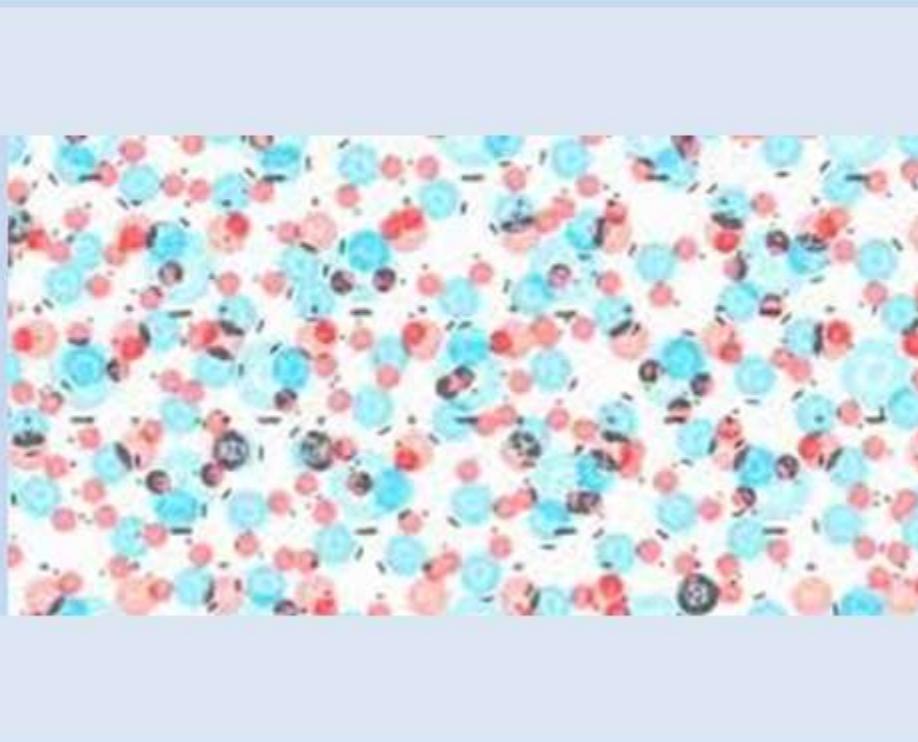

Drinking water source protection is essential

## Water is a universal solvent

**80,000 chemicals and hundreds of micro- organisms in our environment**

Water can contain traces of thousands of substances

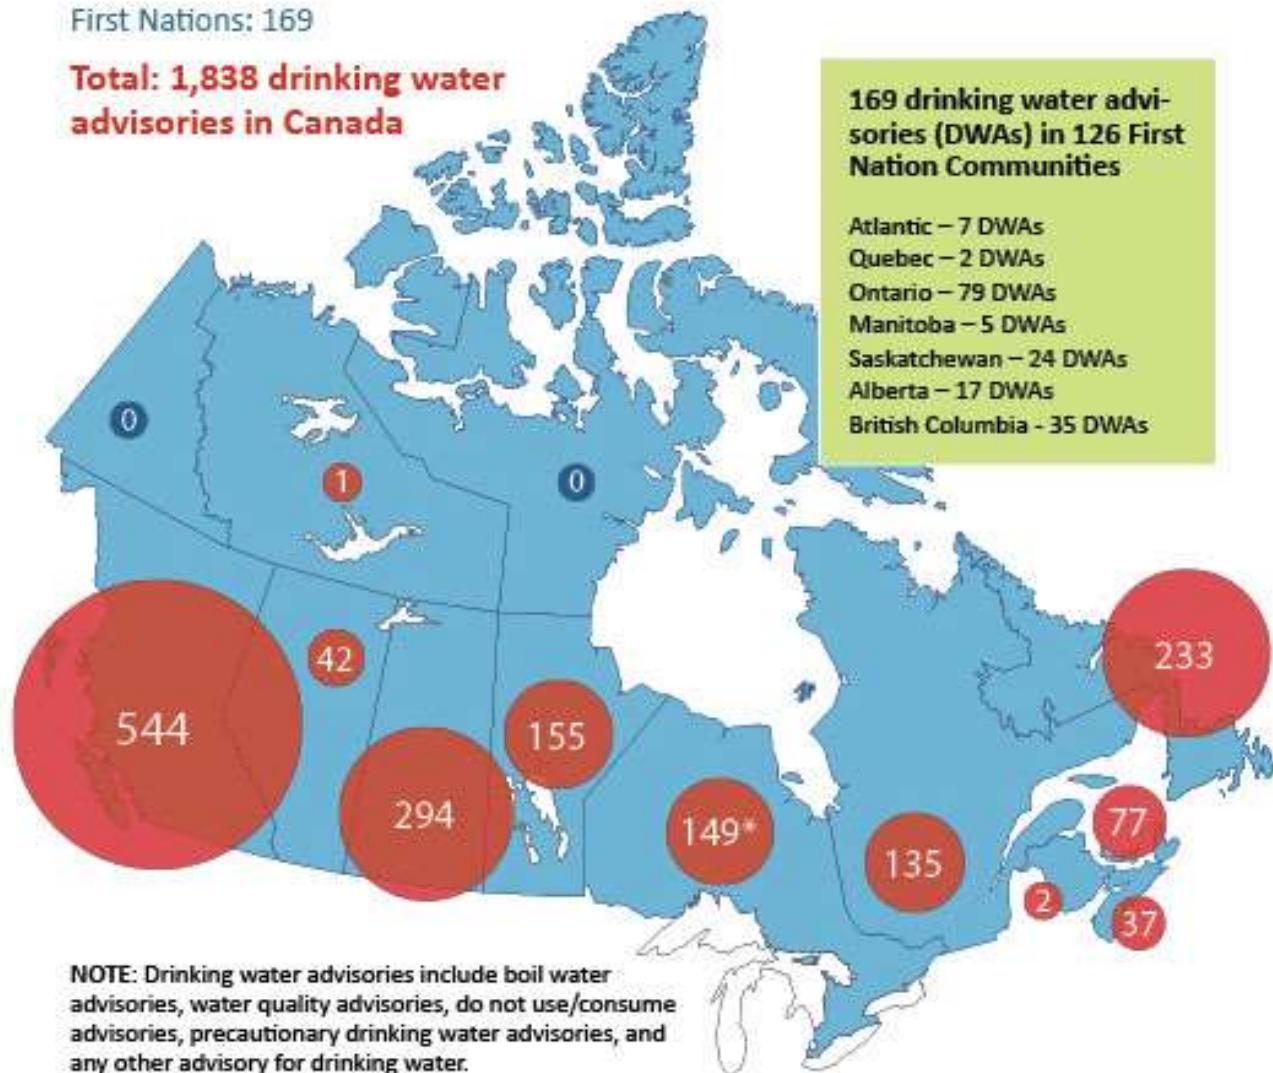

# Drinking water advisories by jurisdiction

Provinces and territories: 1,669

First Nations: 169

**Total: 1,838 drinking water advisories in Canada**

**NOTE:** Drinking water advisories include boil water advisories, water quality advisories, do not use/consume advisories, precautionary drinking water advisories, and any other advisory for drinking water.

\*Information for Ontario only includes Boil Water Advisories.

Water treatment  
is necessary in  
many situations

Is expensive and  
uses a lot of energy  
and chemicals

Disinfection can kill some biological contaminants

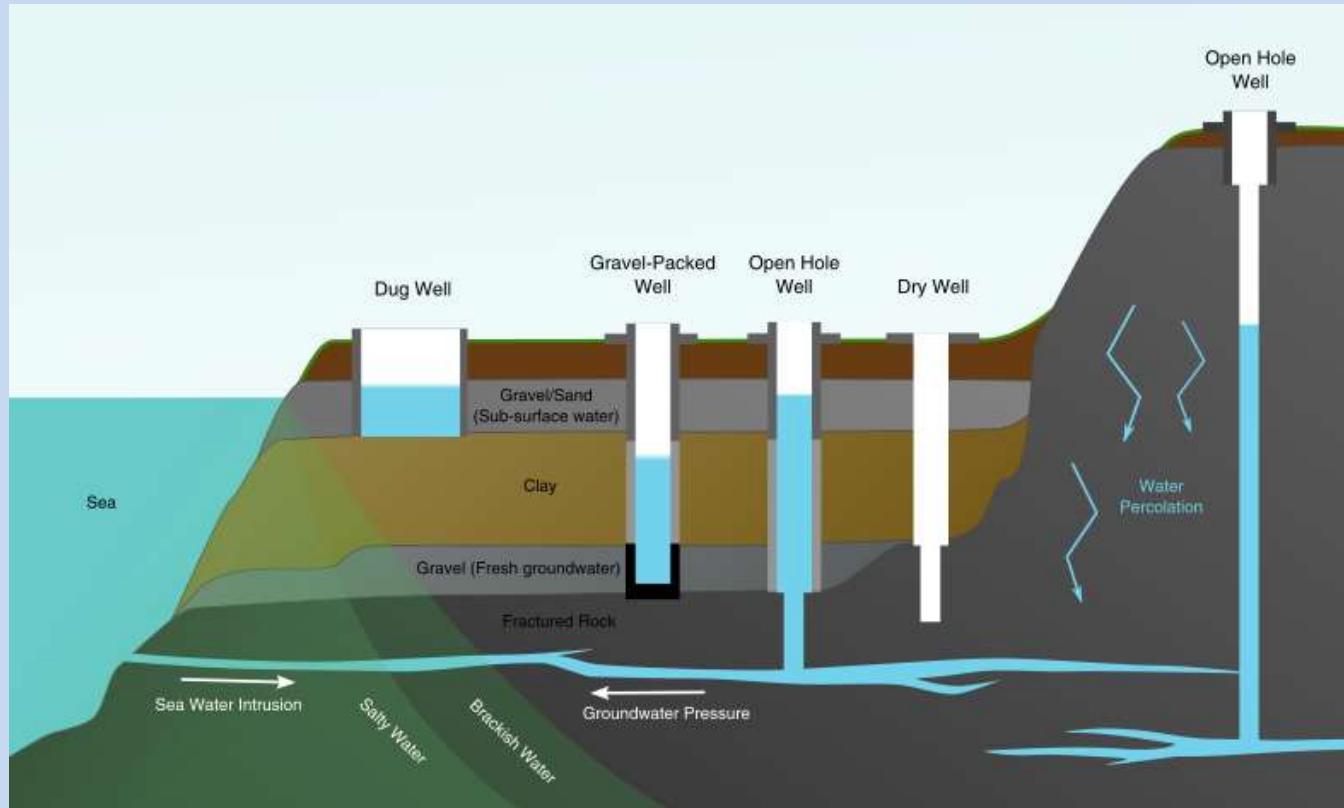

Disinfection with chlorine can have adverse health effects

# Groundwater in this area

There are thousands of wells

**City reservoir at  
the end of  
Despard Avenue**

**Alberni Highway +  
Church Rd Errington**

**Wells supplied by  
ground water and  
surface water**

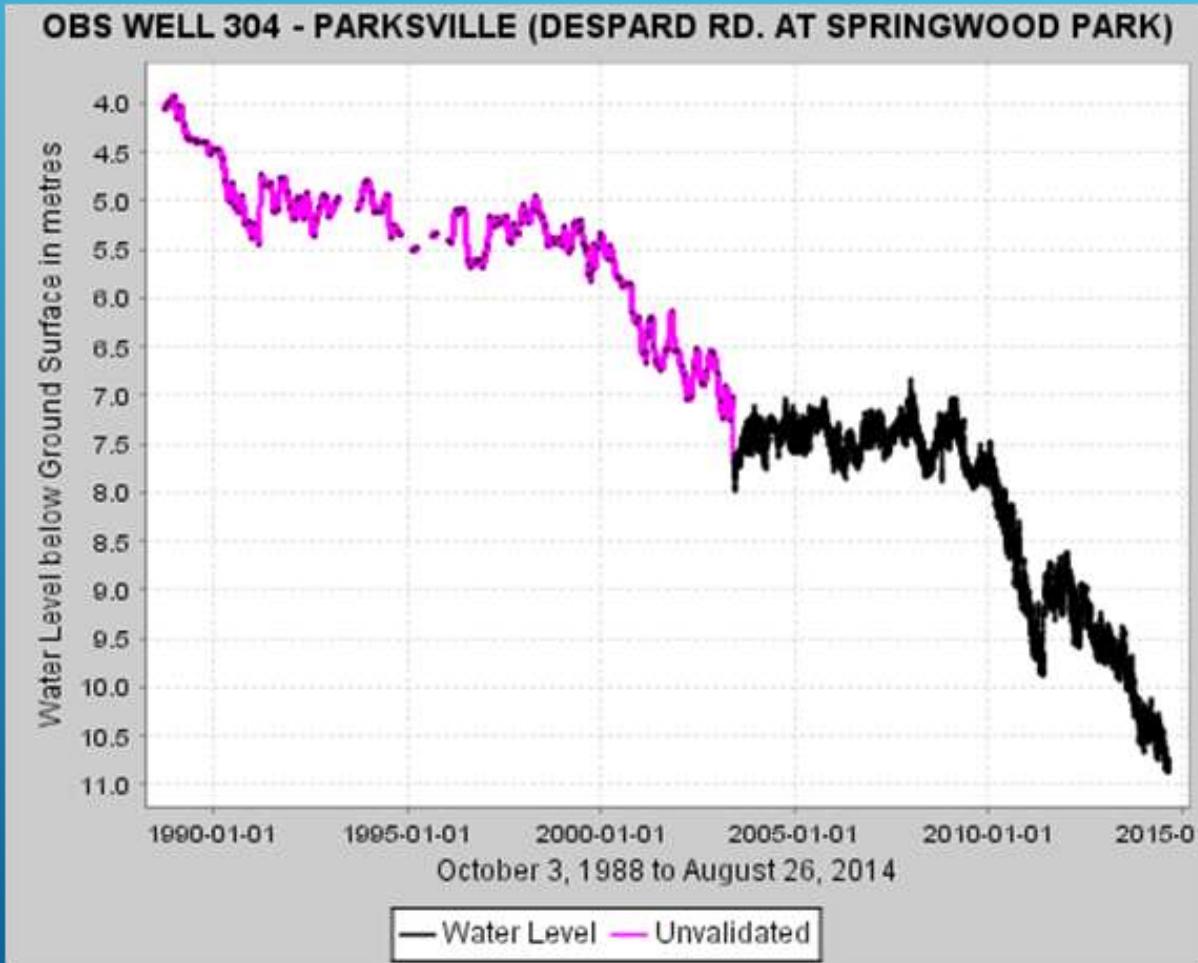

**Little  
Mountain**

**Errington  
Center**

©2010 Google

**The groundwater levels at an observation well in Springwood Park continue to drop at an alarming rate. The level is now down to 11 meters. Historically the groundwater level was at the surface of the land.**

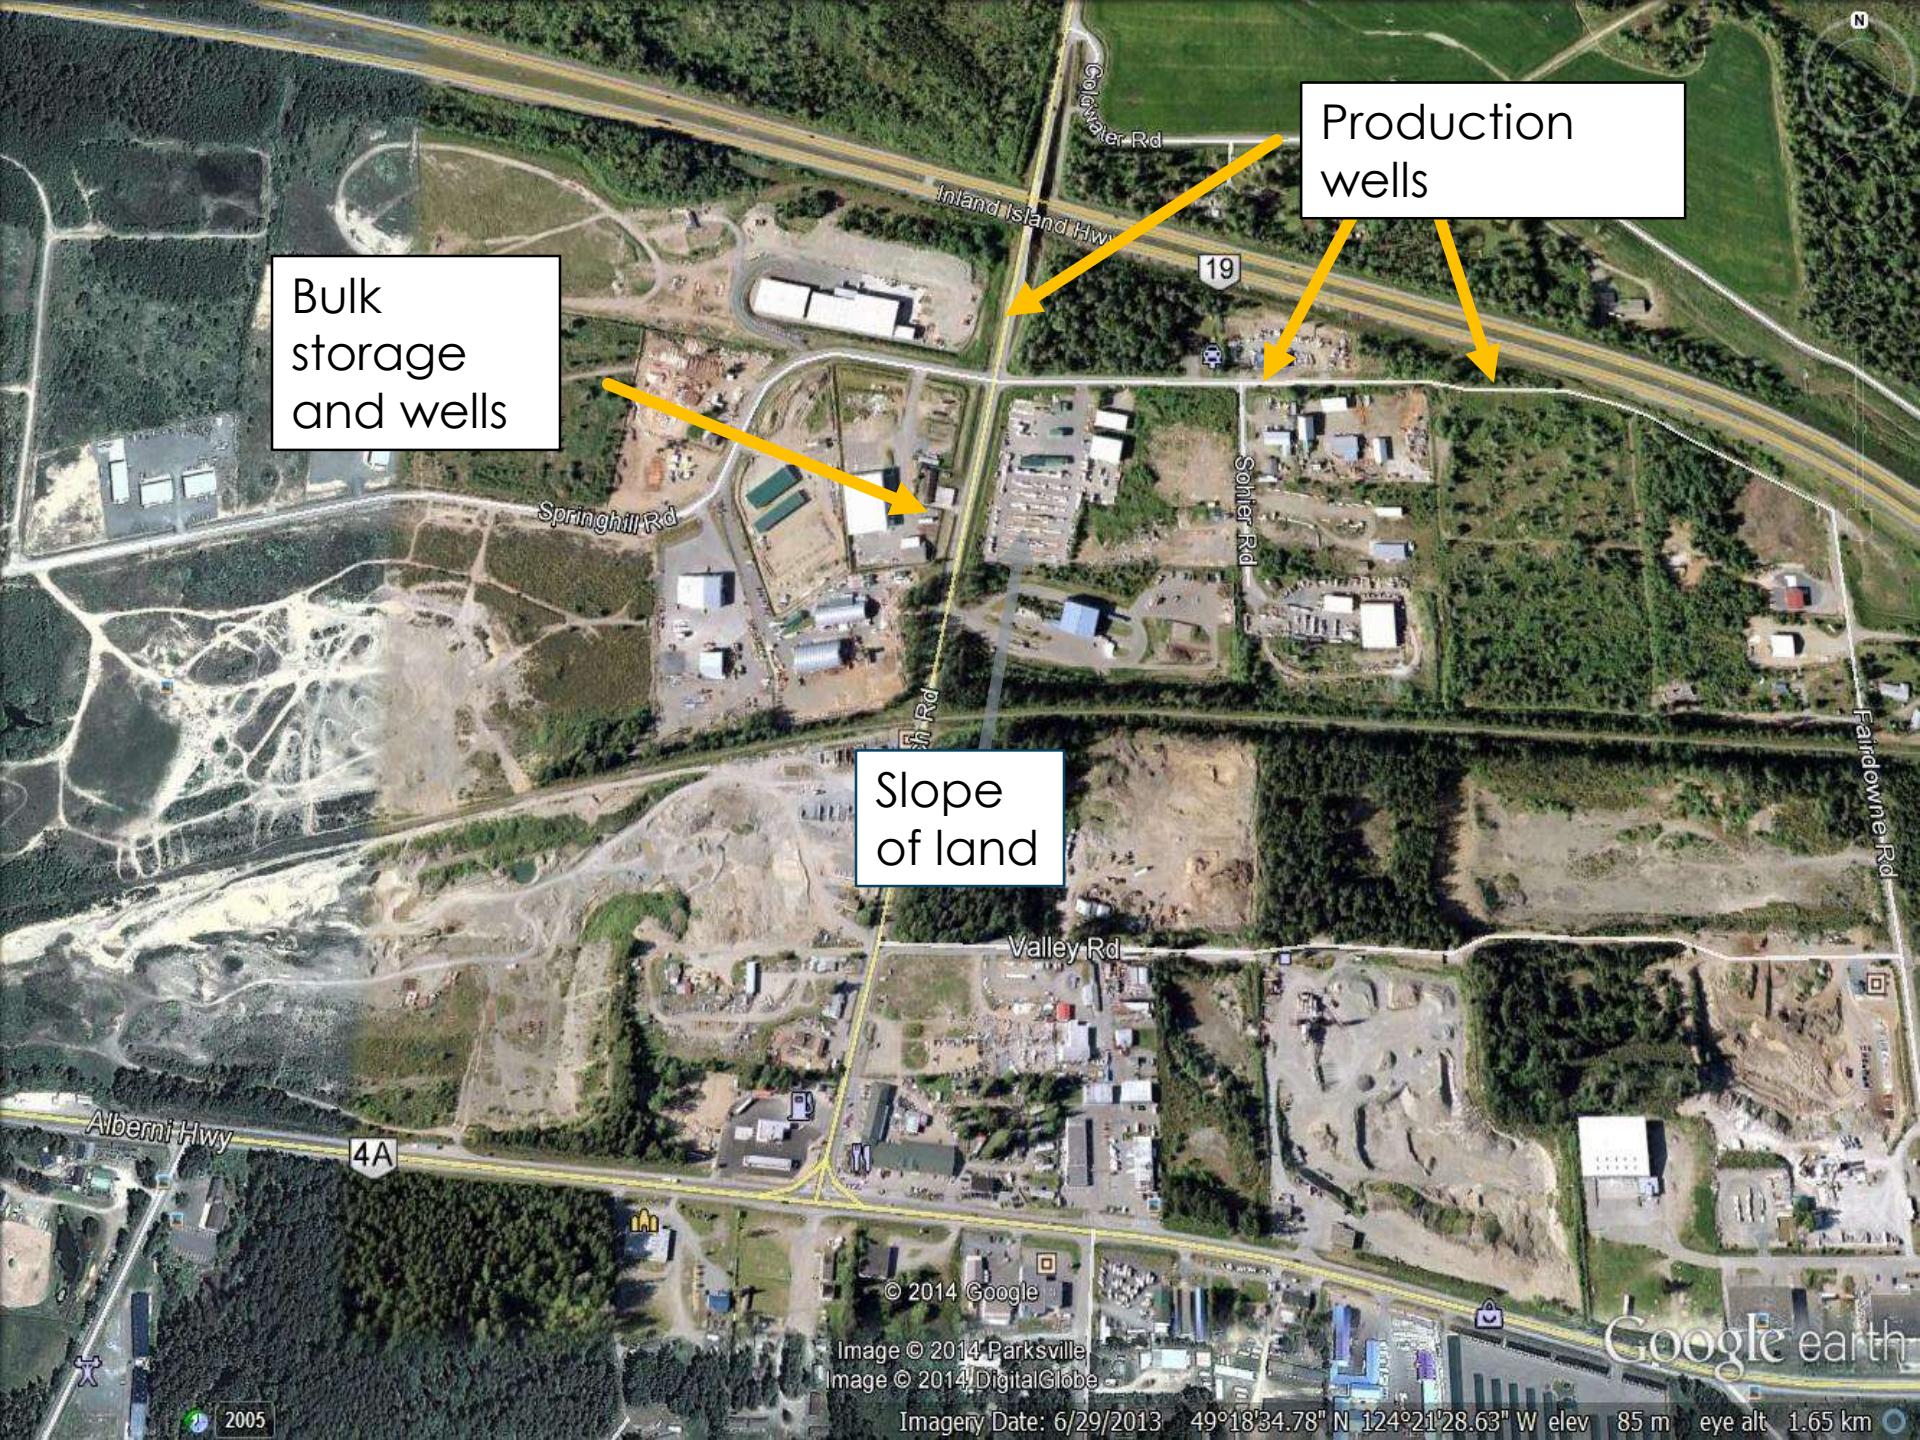

The continued decline indicates that extraction at the current rates is unsustainable.

**The lowering groundwater levels also increase the risks to human health from contaminating land uses in the groundwater recharge areas.**

Production  
wells

Bulk  
storage  
and wells

Slope  
of land

## SLAPP Strategic Lawsuits Against Public Participation

Such concerns should be brought through the BC legal system

VIHA

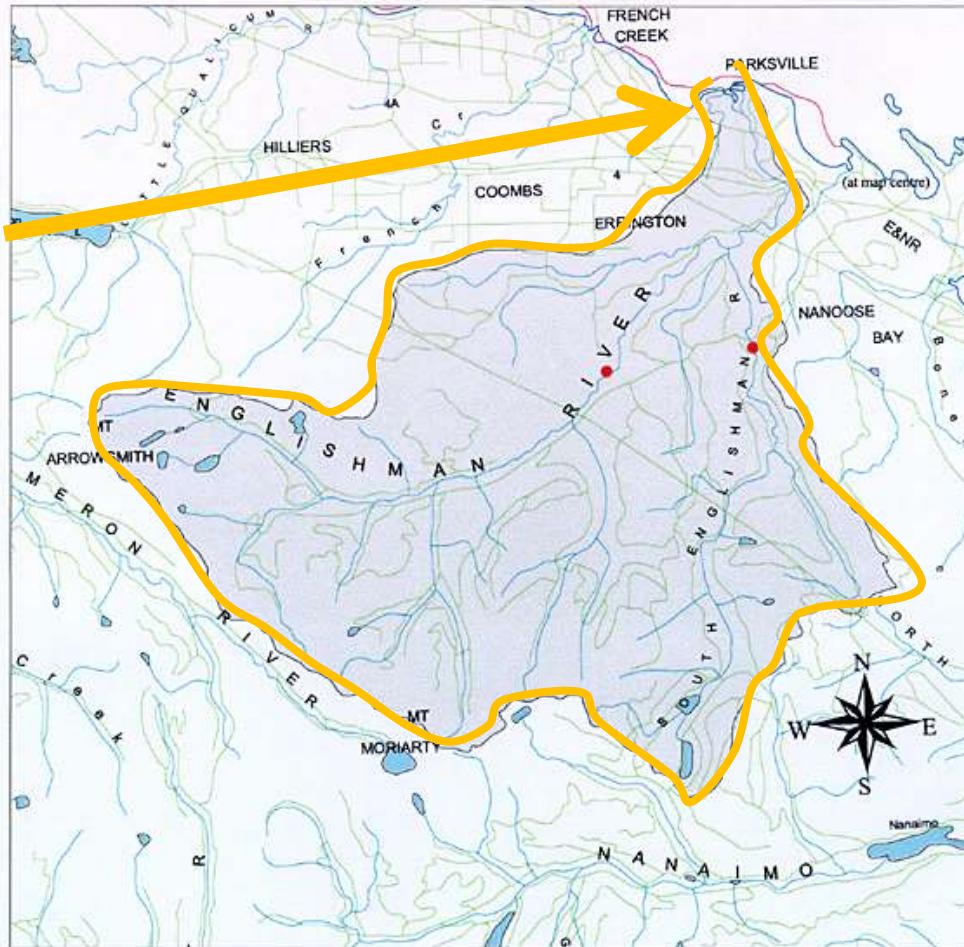

**Parkville's drinking water,  
from surface water sources.**

**The Arrowsmith Water Service drinking  
water supply originates from within the  
Englishman River Watershed.**

**The service supplies water to the City of  
Parksville and areas within the Regional  
District of Nanaimo**

# Englishman River Watershed

The intake for the drinking water system is located just below the orange bridge in Parksville

NTS Text (1:250K)  
NTS Transportation (1:250K)  
NTS Water Features (1:250K)

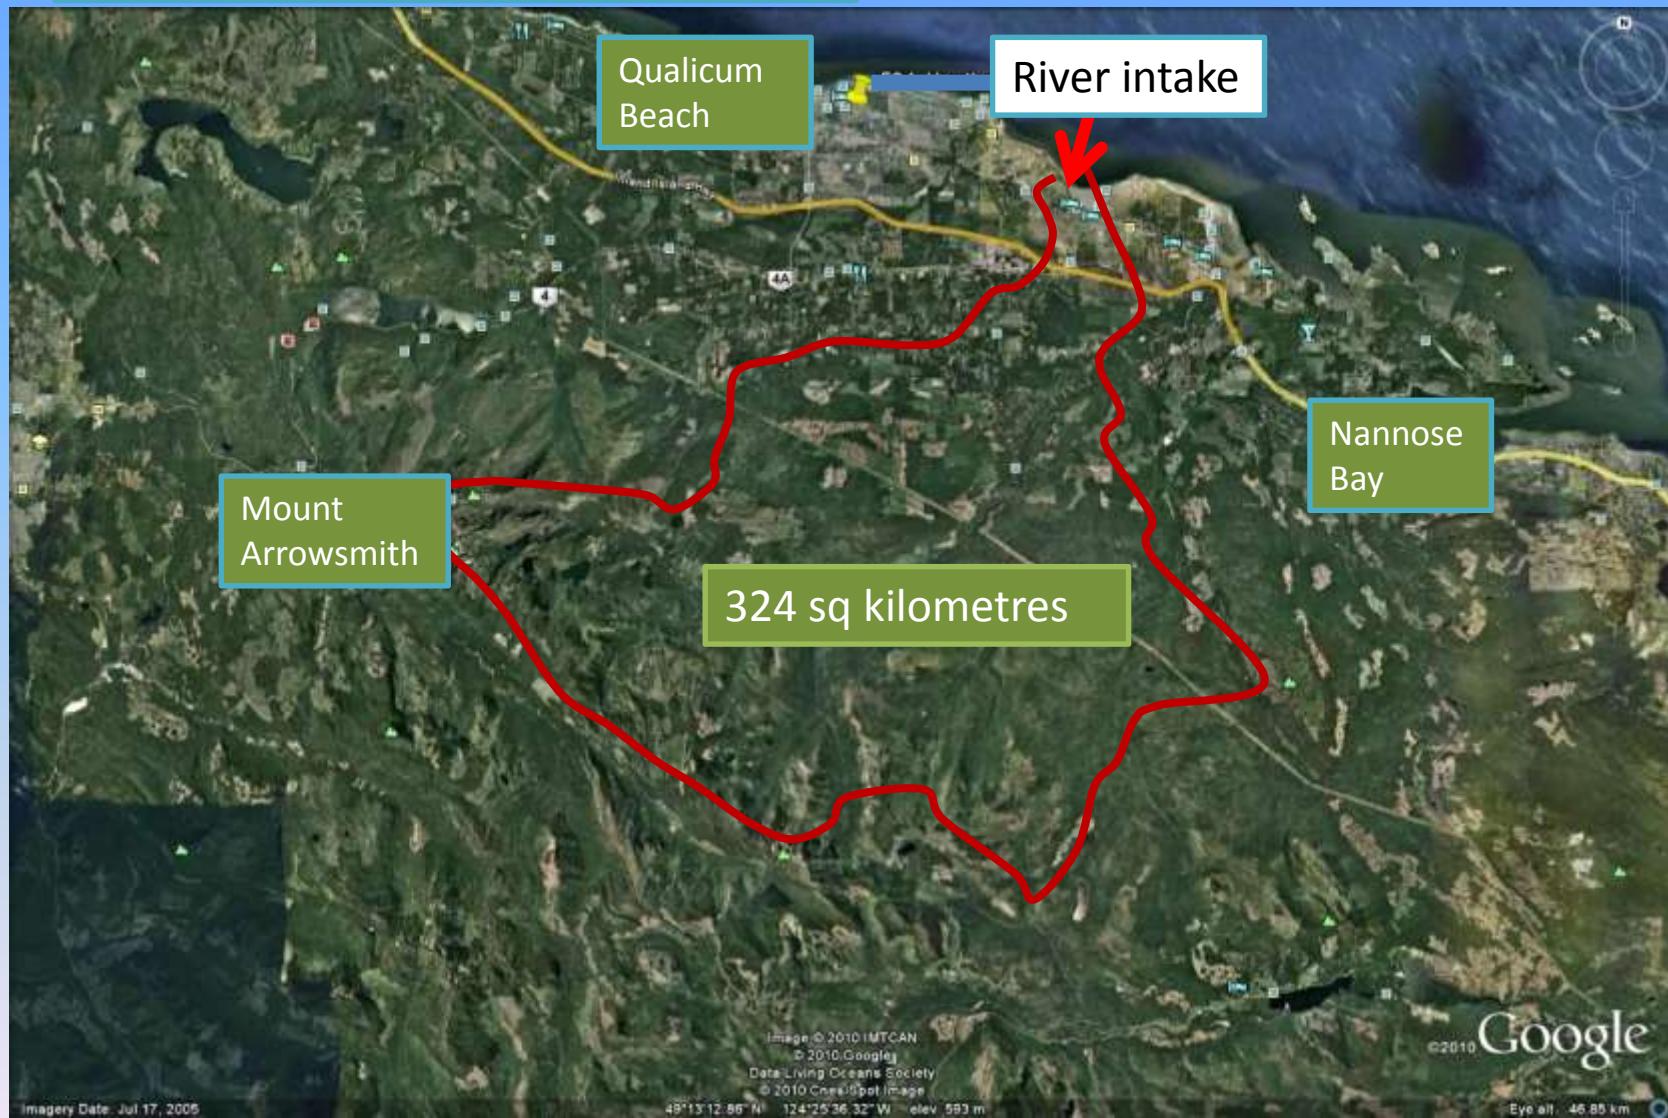

River/Stream - Definite  
Coastline - Definite

Englishman River Watershed

Approximate Location of Anadromous Barrier

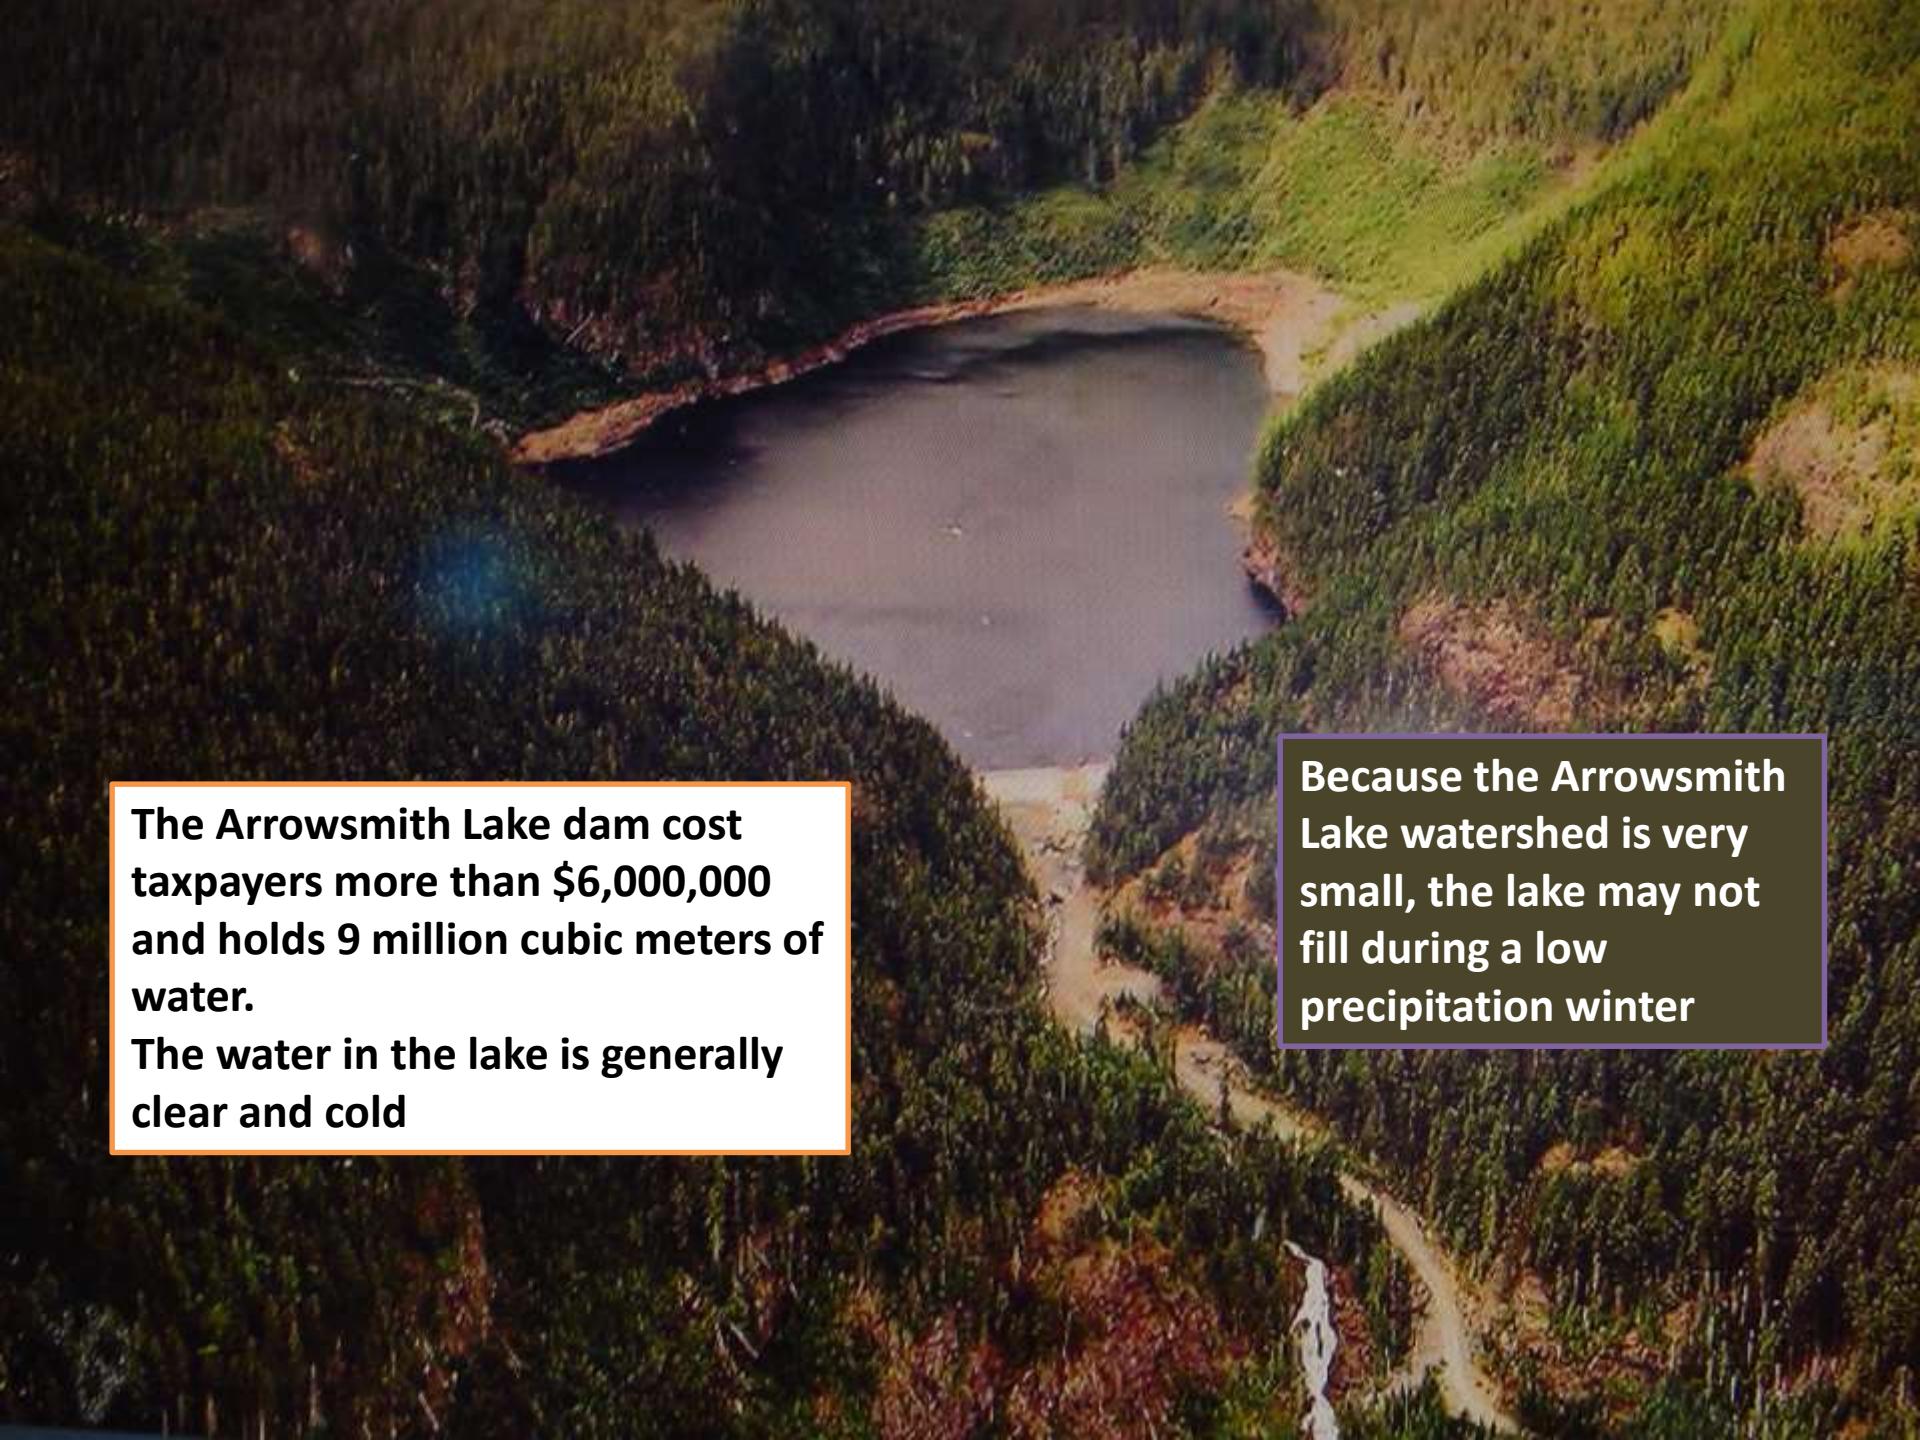

## Parksville Drinking Water Source

The current surface water intake is not dependable to supply safe drinking water, for a growing population

An aerial photograph of a lake nestled in a mountainous, forested area. The lake is a dark blue-grey color, reflecting the surrounding green trees and hills. A dirt road or path leads towards the lake from the bottom right corner of the frame. The terrain is rugged and covered in dense vegetation.

**The Arrowsmith Lake dam cost taxpayers more than \$6,000,000 and holds 9 million cubic meters of water.**

**The water in the lake is generally clear and cold**

**Because the Arrowsmith Lake watershed is very small, the lake may not fill during a low precipitation winter**

# *City of Parksville Water Supply & Distribution System*

***April 2011***

The following 4 slides  
include questions that are  
superimposed onto a  
presentation made in 2011

*Prepared By:  
Mike Squire, AScT  
Manager of Operations*

*City of  
Parksville*

# City of Parksville Water System Overview

Two Sources.....

Englishman River

51 %

Railway Wells

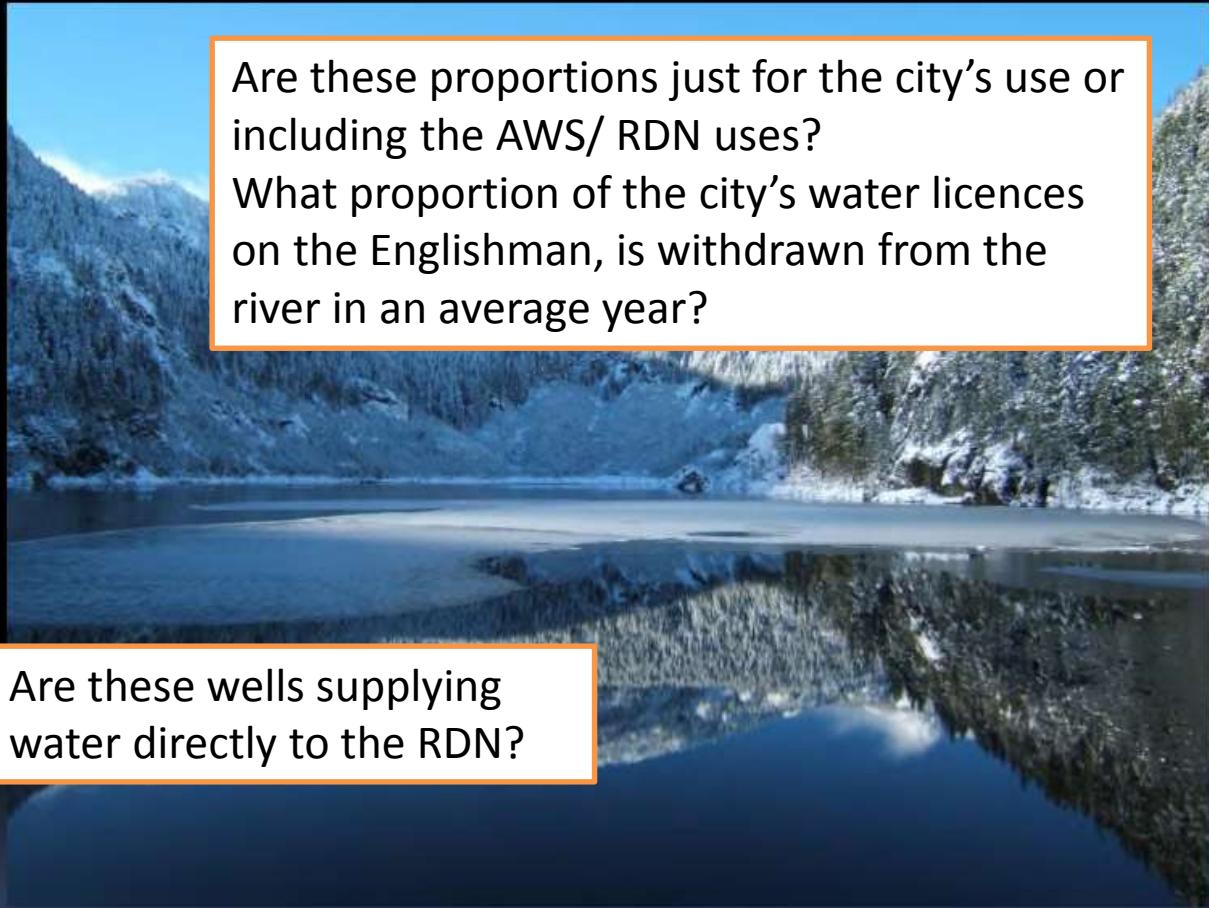

24 %

Springwood Wells

25 %

Are these proportions just for the city's use or including the AWS/ RDN uses?

What proportion of the city's water licences on the Englishman, is withdrawn from the river in an average year?

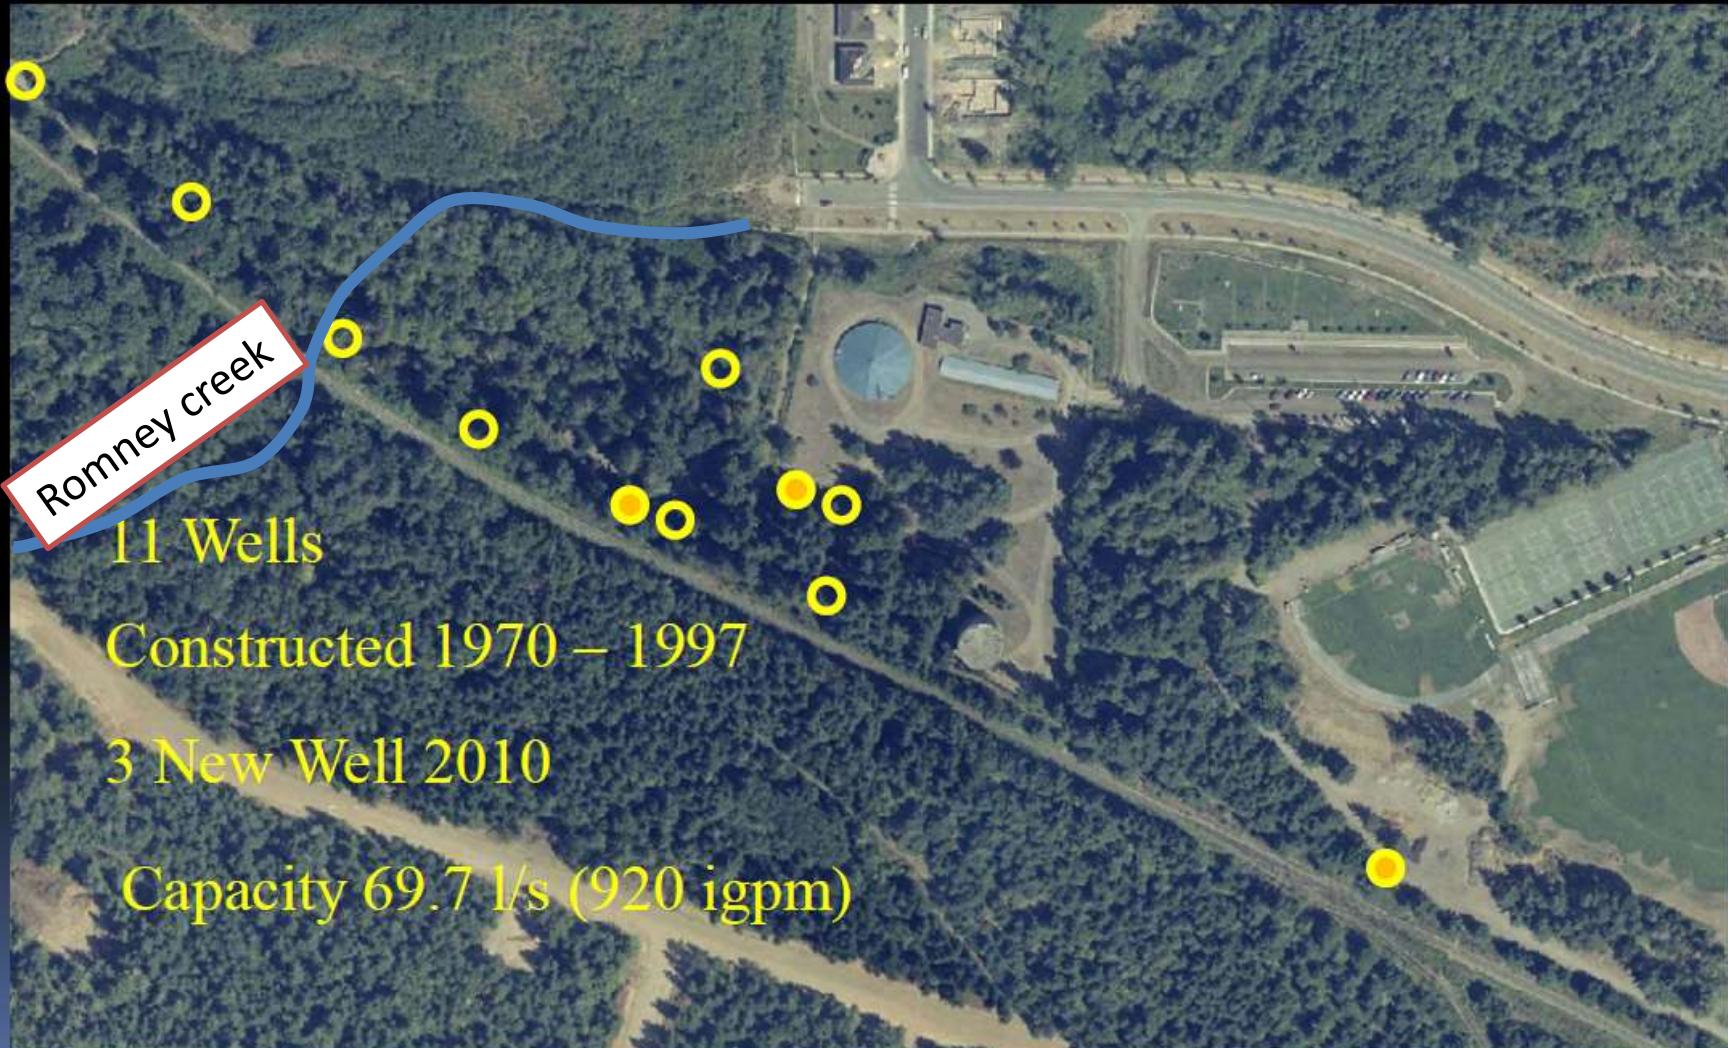

Arrowsmith Lake Reservoir

# Overview

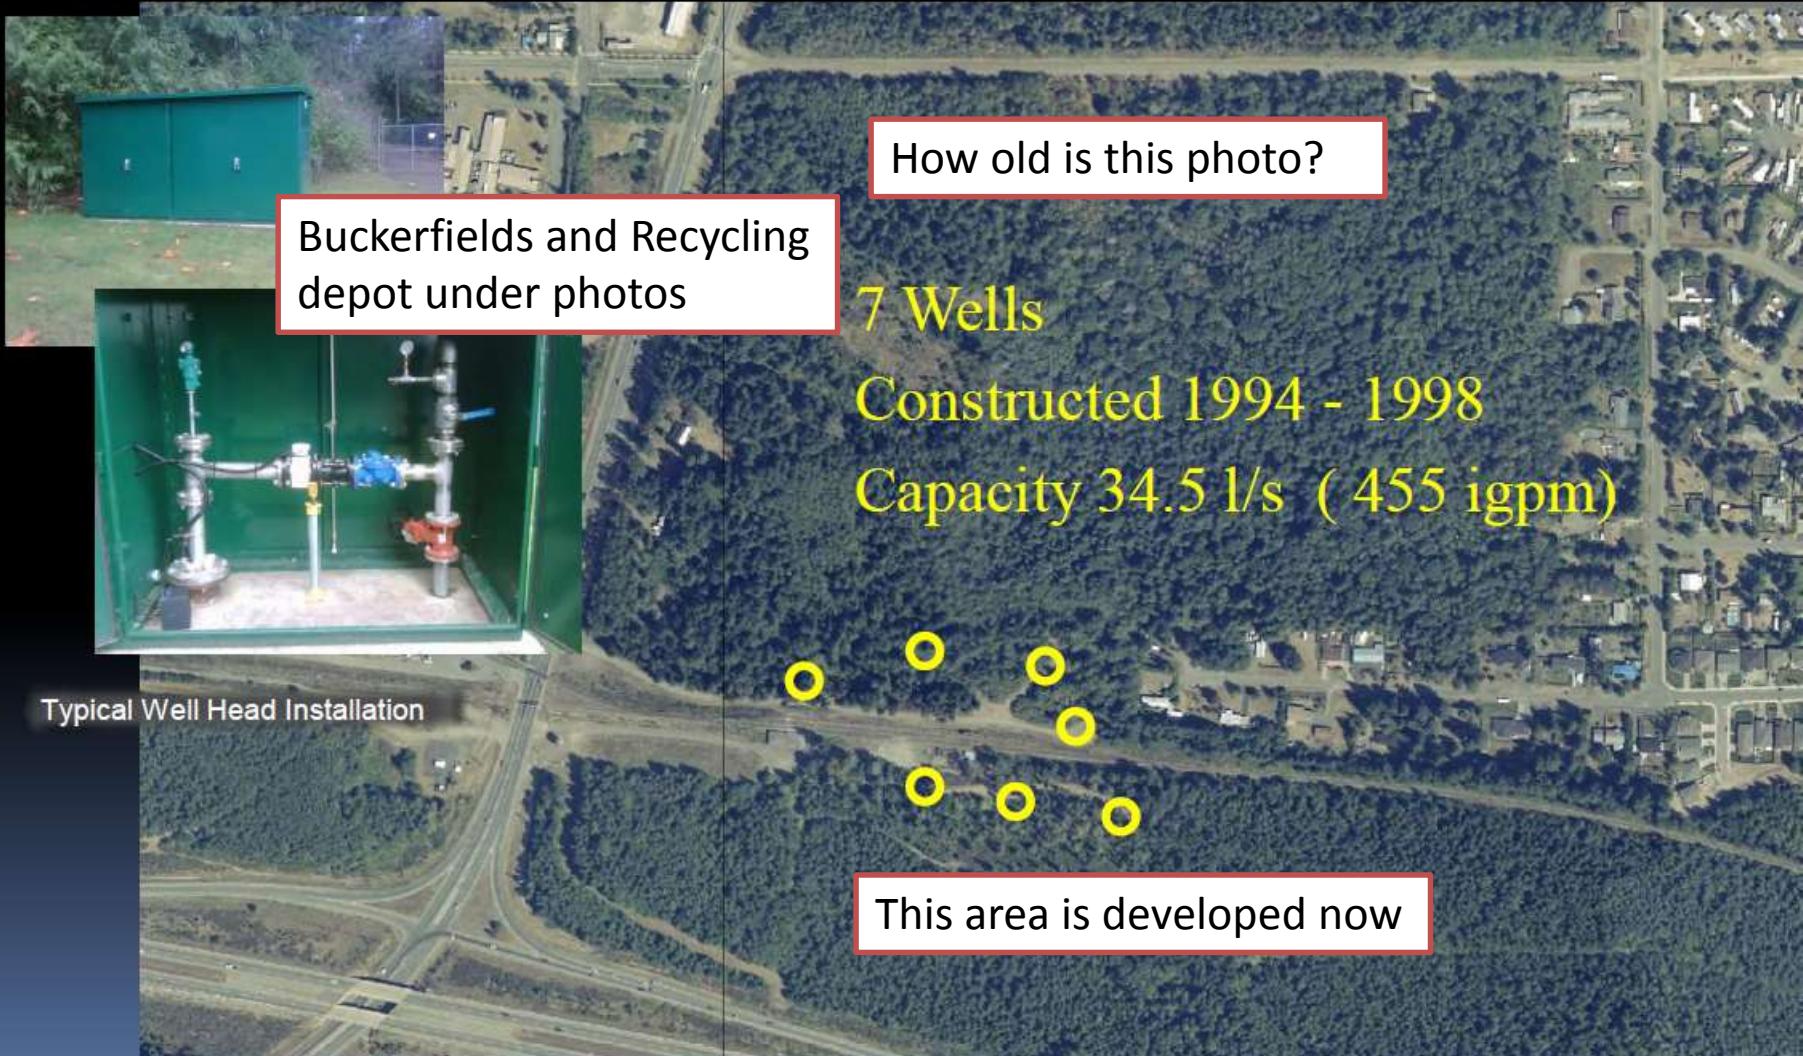

## Springwood Wells

This air photo is several years old  
areas have been developed since it  
was taken ?

# Overview

## Railway Wells

# Why do we need Water Treatment and a New Intake ?

Total Annual Water Use - City of Parksville (m<sup>3</sup>)

What does this graph look like with RDN water use included ?

Total Annual Water Use – Declining Trend

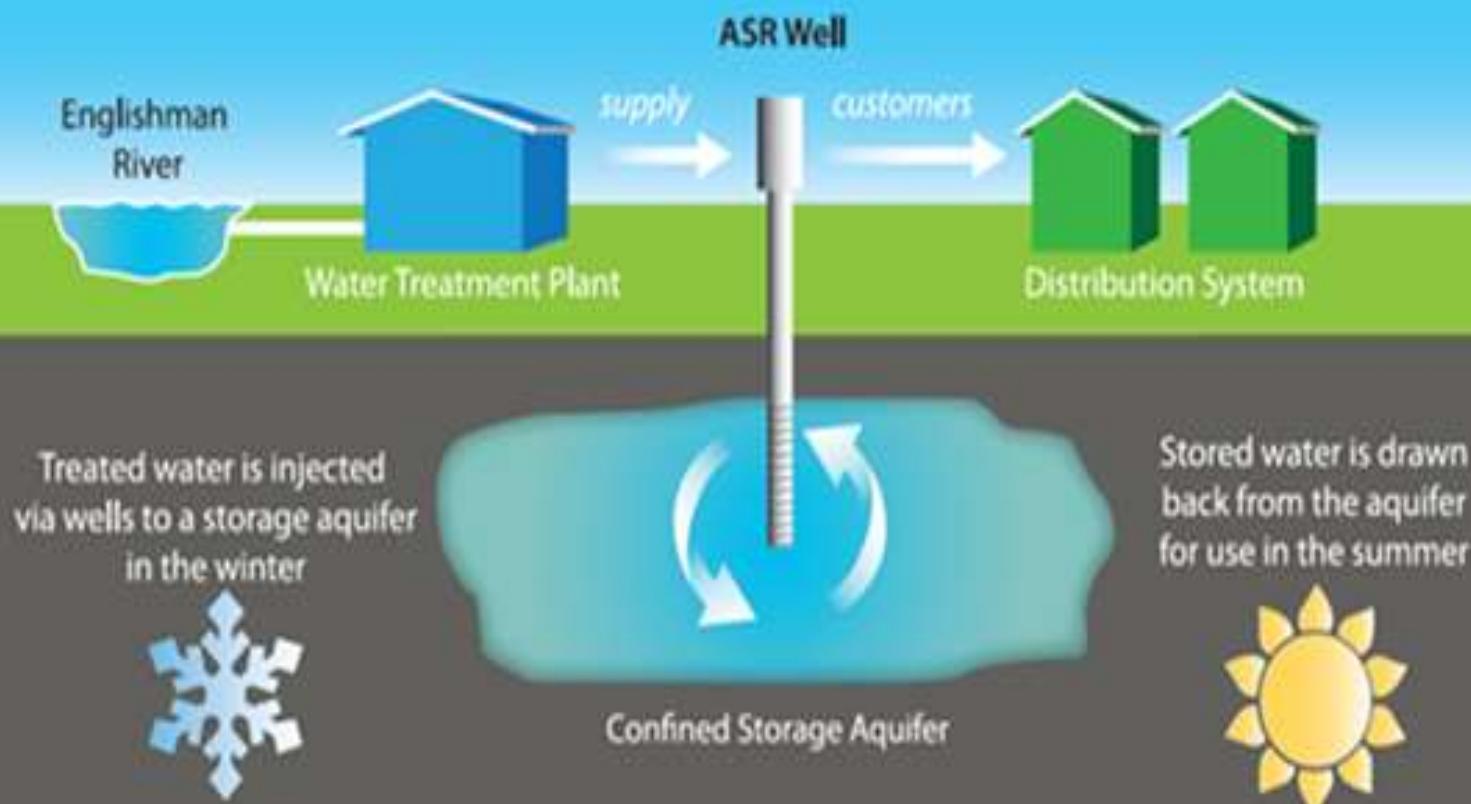

**needed a lot of water  
before the development  
of the next phase could  
continue**

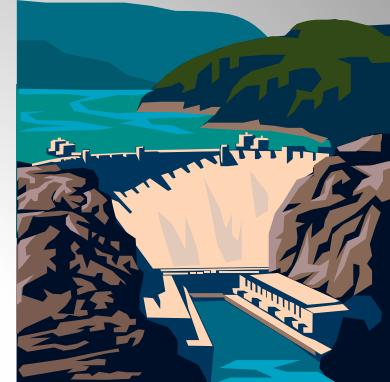

## Typical ASR Well Schematic

## Heavily engineered approach:

Extensive planning and design component

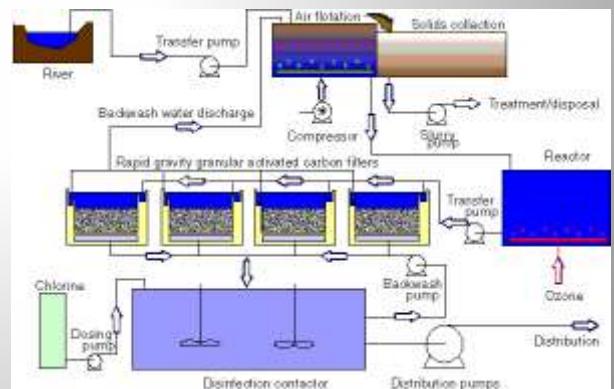

Dependence on expensive construction resources i.e. concrete, pipe, pumps, labour

High level of maintenance costs i.e. electrical energy, chemicals, labour etc.

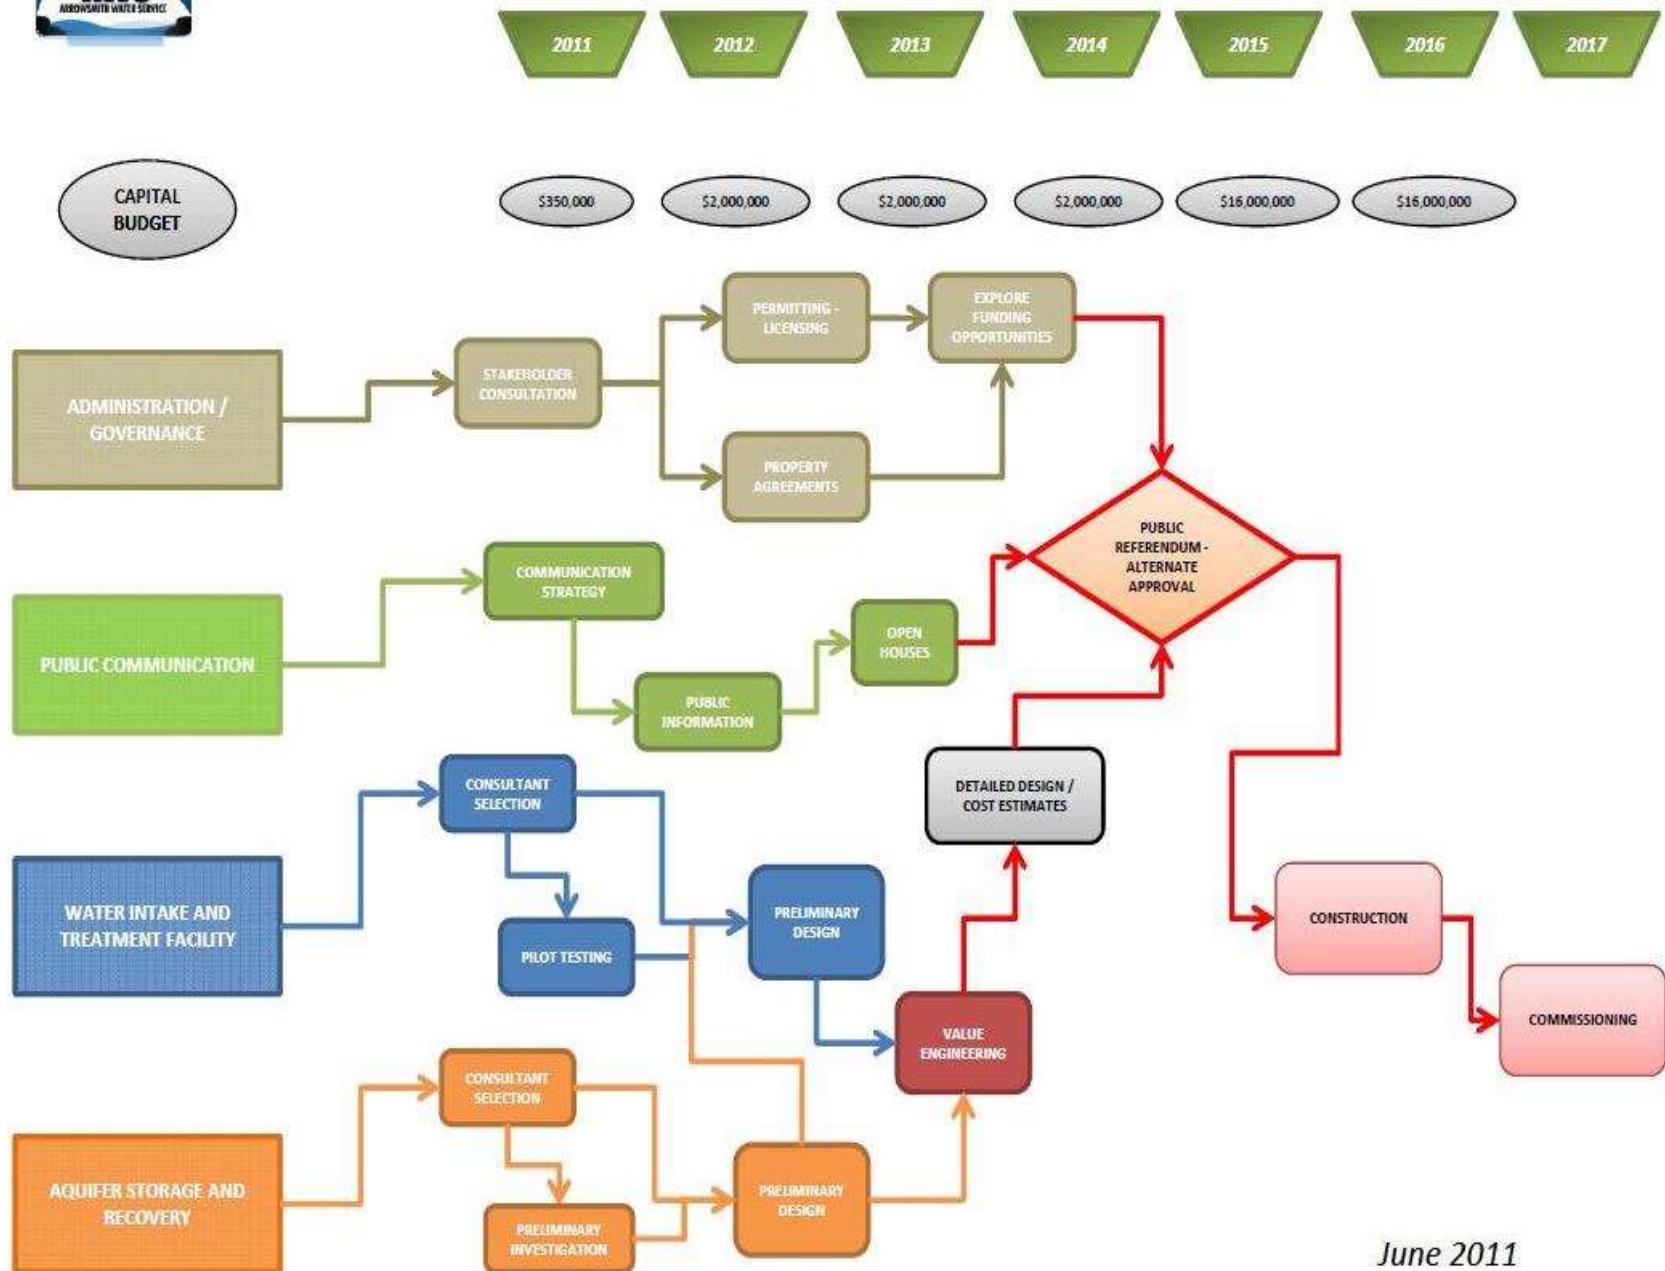

Infrastructure commitment is more centralised and not readily adaptable

## AWS – IMPLEMENTATION PLAN SCHEDULE (*critical path*)

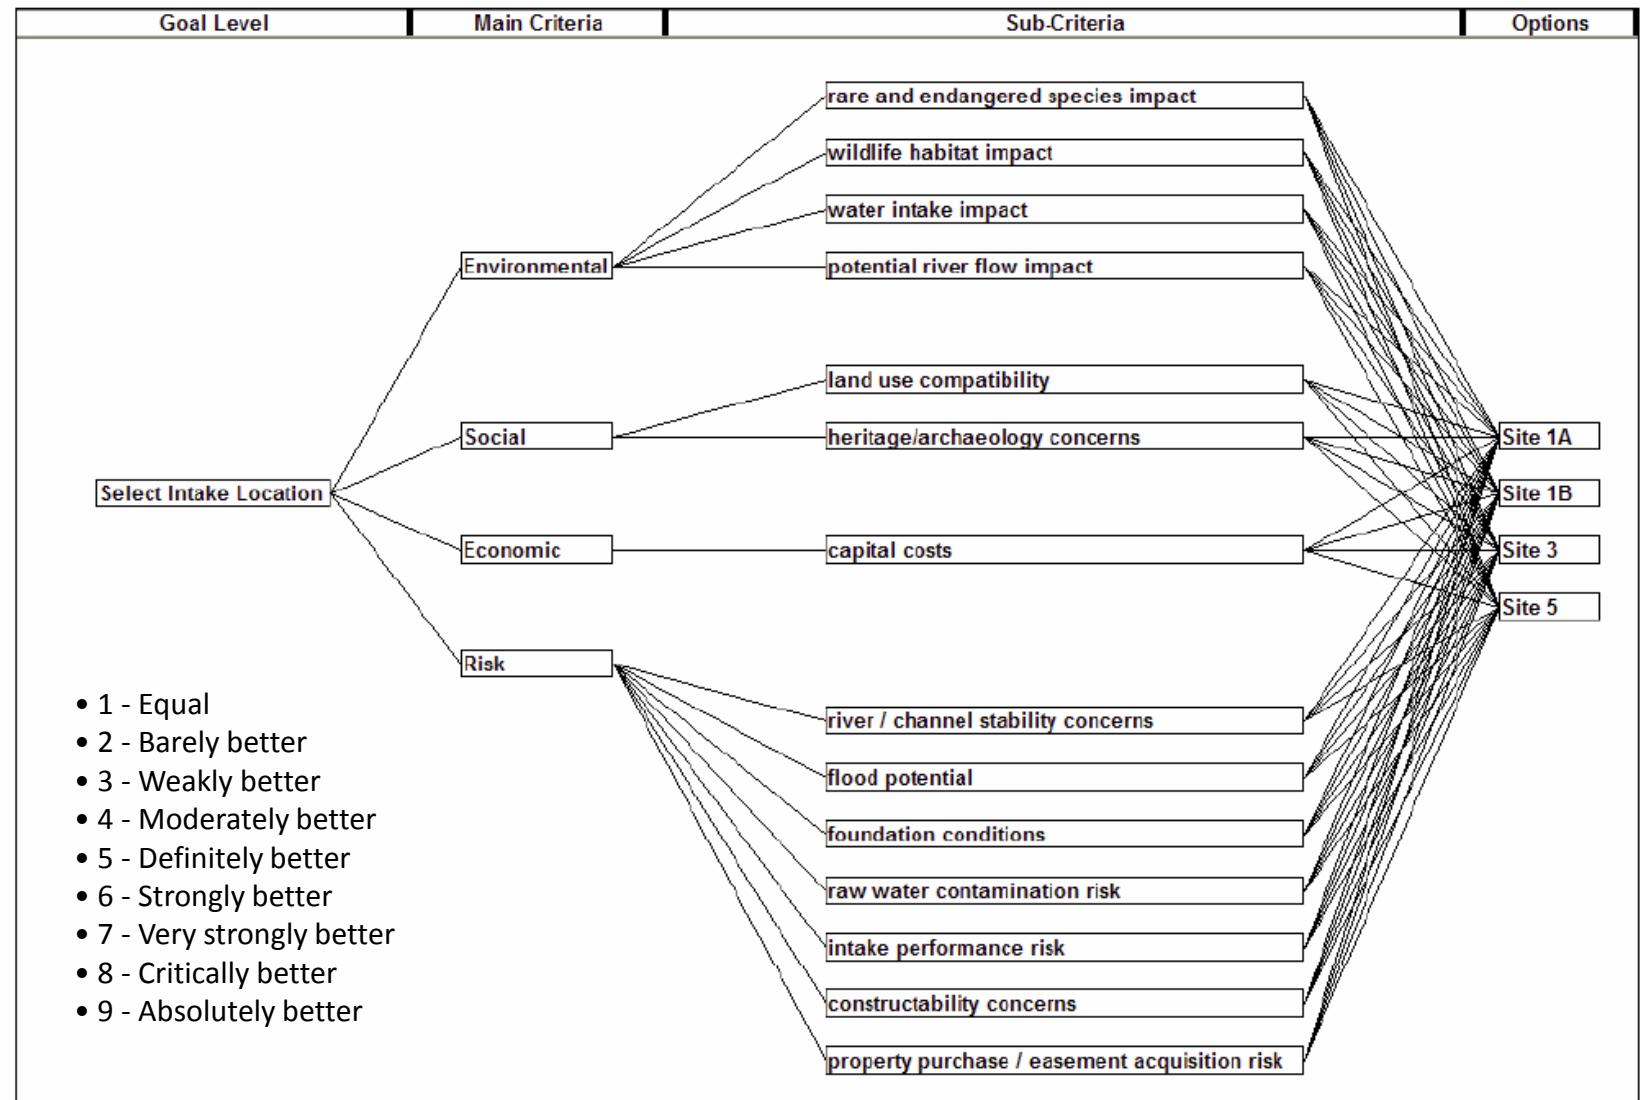

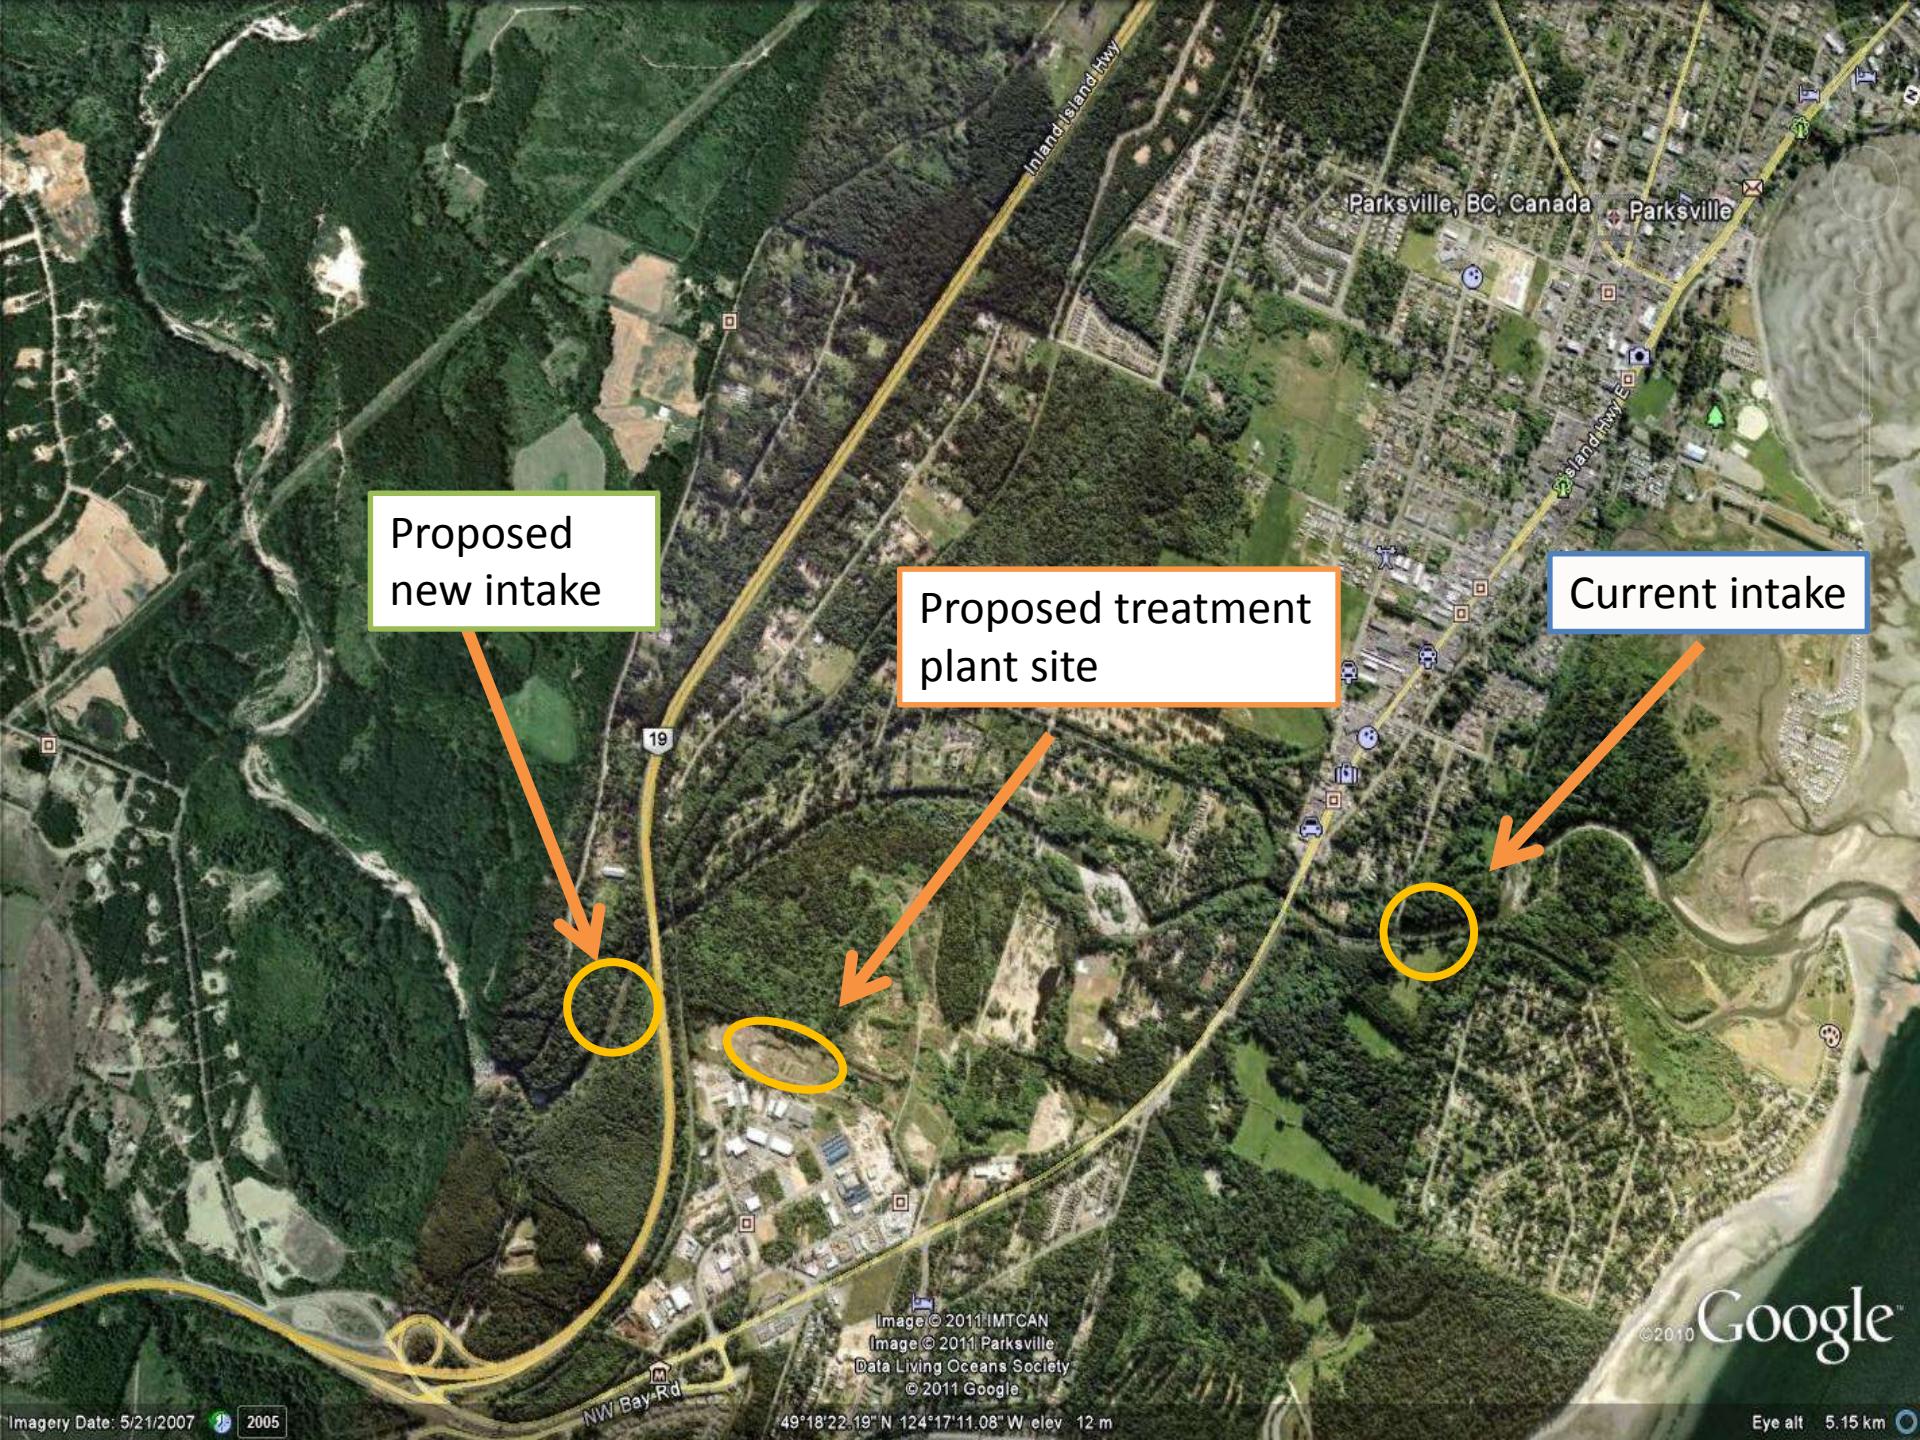

June 2011

## From AWS consultants report

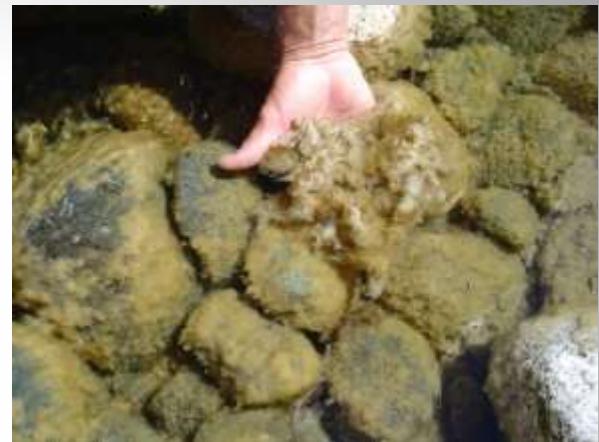

Graph below extracted from report. [http://www.arrowsmithwaterservice.ca/aws\\_documents/aws\\_dp8-2.pdf](http://www.arrowsmithwaterservice.ca/aws_documents/aws_dp8-2.pdf)

## **Triple Bottom Line + Risk Criteria**

Will the proposed treatment plant, treat a wide range of possible contamination threats?

Auto wrecker upstream

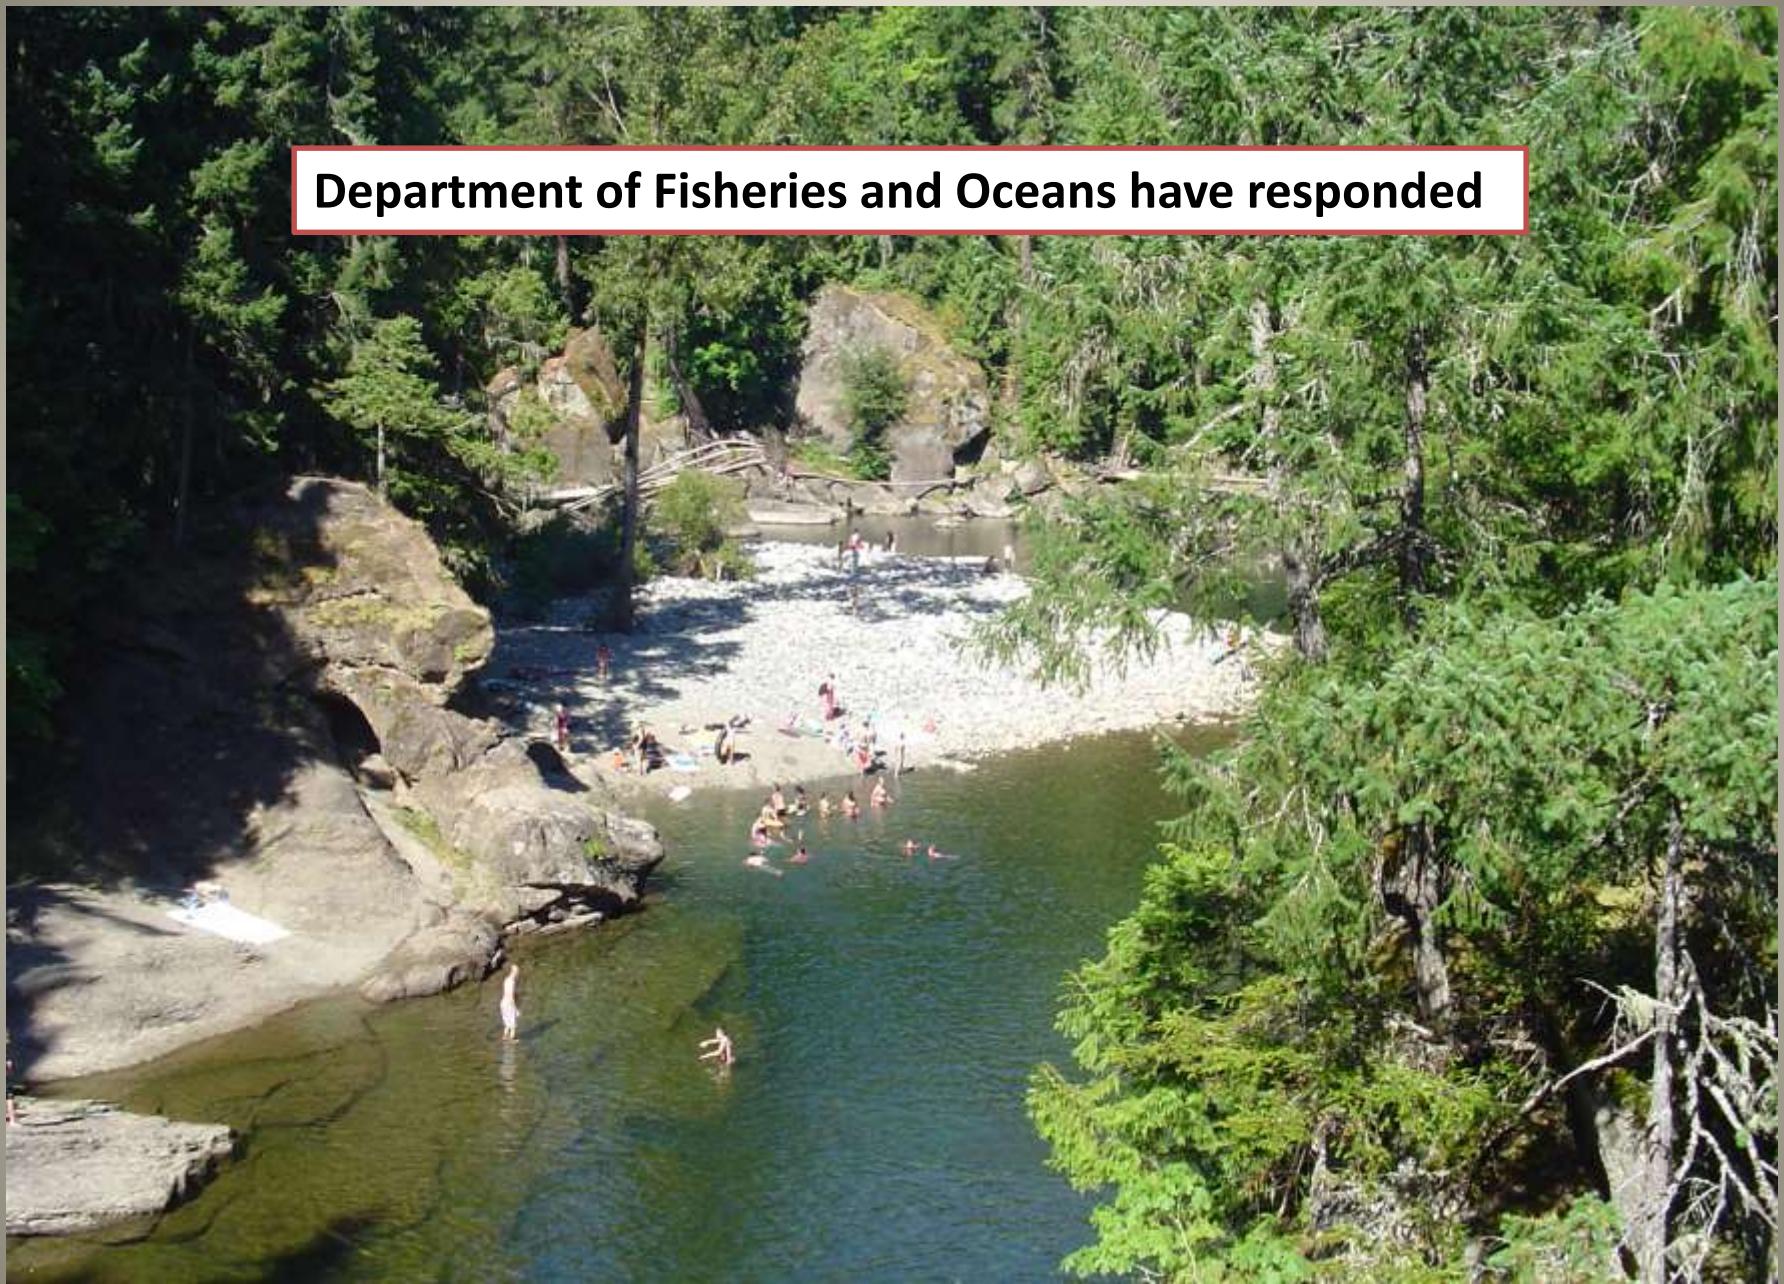

A photograph of a river scene. In the foreground, a rocky riverbank is visible on the left, leading into the water. The water is dark and reflects the surrounding environment. On the right side of the image, there is a large, steep cliff made of grey, layered rock. Some green vegetation, including small trees and shrubs, is growing on the upper part of the cliff. The sky is overcast and grey.

Bank collapse partially blocking river upstream of the new multi-million dollar intake and treatment plant.

A catastrophic collapse of the clay banks could cause significant problems by temporarily damming the river and possibly creating a flash flood.

**Department of Fisheries and Oceans have responded**

## Suggested Operational Cost Comparison Between Proposed ASR system and a Natural Advantage System (NAS)

<u>Relative Cost/ Risk Potential</u>	<u>ASR</u>	<u>NAS</u>
Raw water quality .. potential contamination level	High - Extreme	Very low
Power to pump water for treatment	High	Zero
Cost of first treatment	+ - Very High	Minimal
Cost to pump water to ASR site	High	Zero
Water loss potential from aquifer	High	Zero
Potential for adverse issues with pressure storage	High	Zero
Cost to pump water out of aquifer	High	Zero
Cost of second treatment	Low	Zero
Cost to pump water for distribution	Moderate	Low
Total infrastructure upkeep and devaluation	High	Low
Cost of personnel, power, treatment chemicals etc	High	Very low
Potential for future costs increases to effect system	High	Very low

**Soft environmentally compatible approach**

**Protect water quality and quantity from the source**

**Take full advantage of surplus winter precipitation**

**Minimize the need for heavy infrastructure**

**Work with the natural topography**

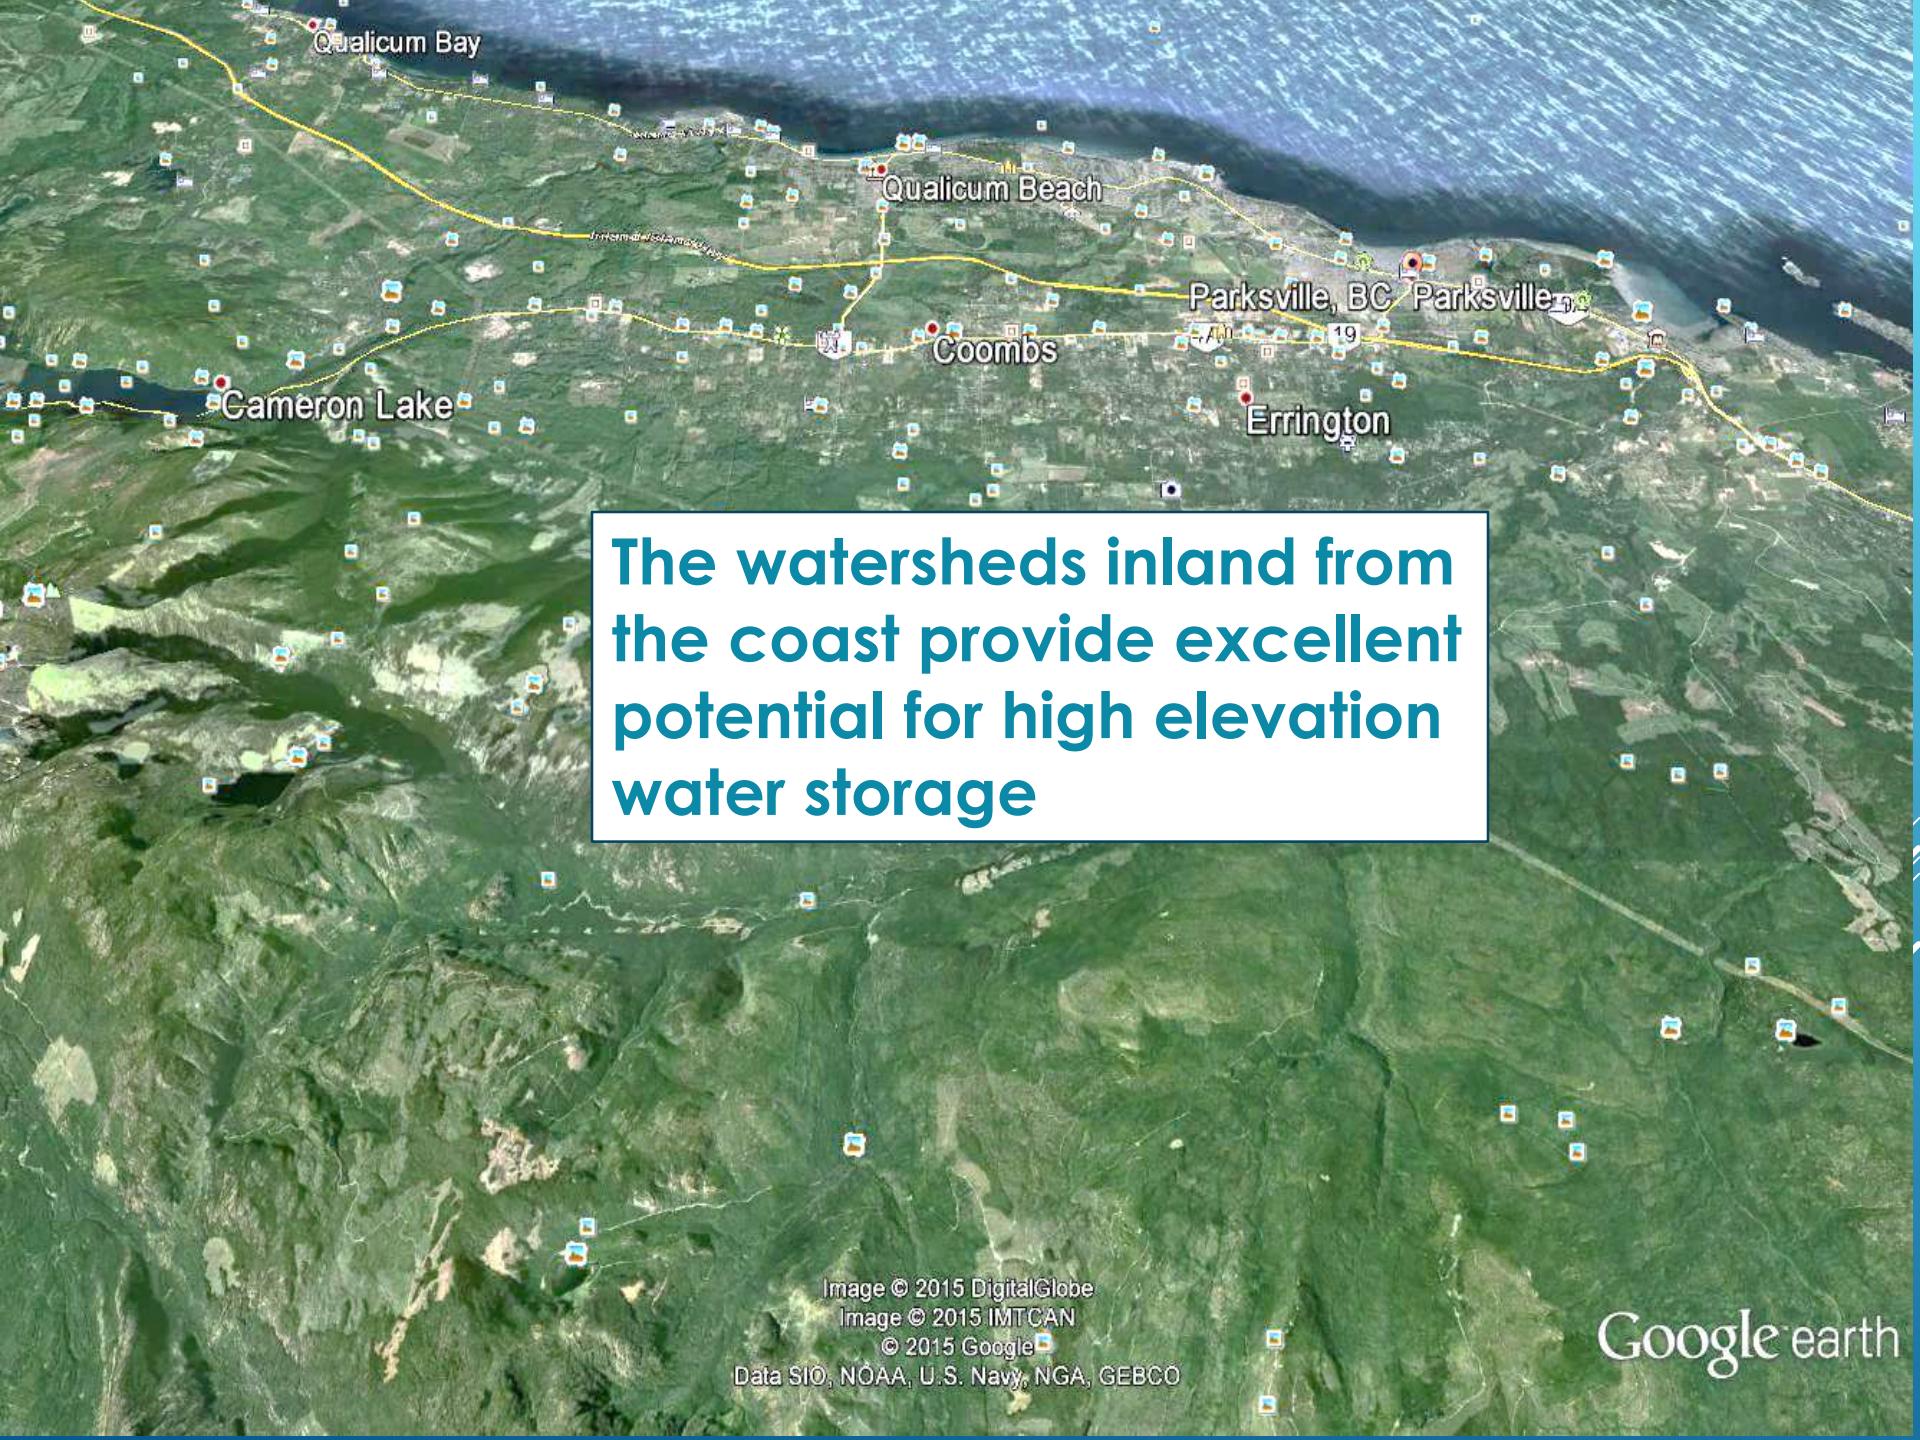

**Develop decentralised, adaptable systems**

Once installed a gravity feed system would require no power and very limited maintenance

Until the settlers came and drained, paved and sucked water out of the ground, mother nature and beavers recharged all of the aquifers for free

The watersheds inland from the coast provide excellent potential for high elevation water storage

Google earth

## **Storing high quality water at high elevation has many benefits**

- 1. Water is relatively clean**
- 2. Minimal contamination risk**
- 3. Provides ecological and fisheries benefits**
- 4. Eliminates the need for summer extraction from the river**
- 5. Reduces storm flooding**
- 6. Will flow downhill for free**
- 7. Very low operational costs**
- 8. Can generate electric power**
- 9. Can supply many different areas**

**High flow diversion and storage of water would occur in late fall, winter and in spring and early summer during storm events.**

Google earth

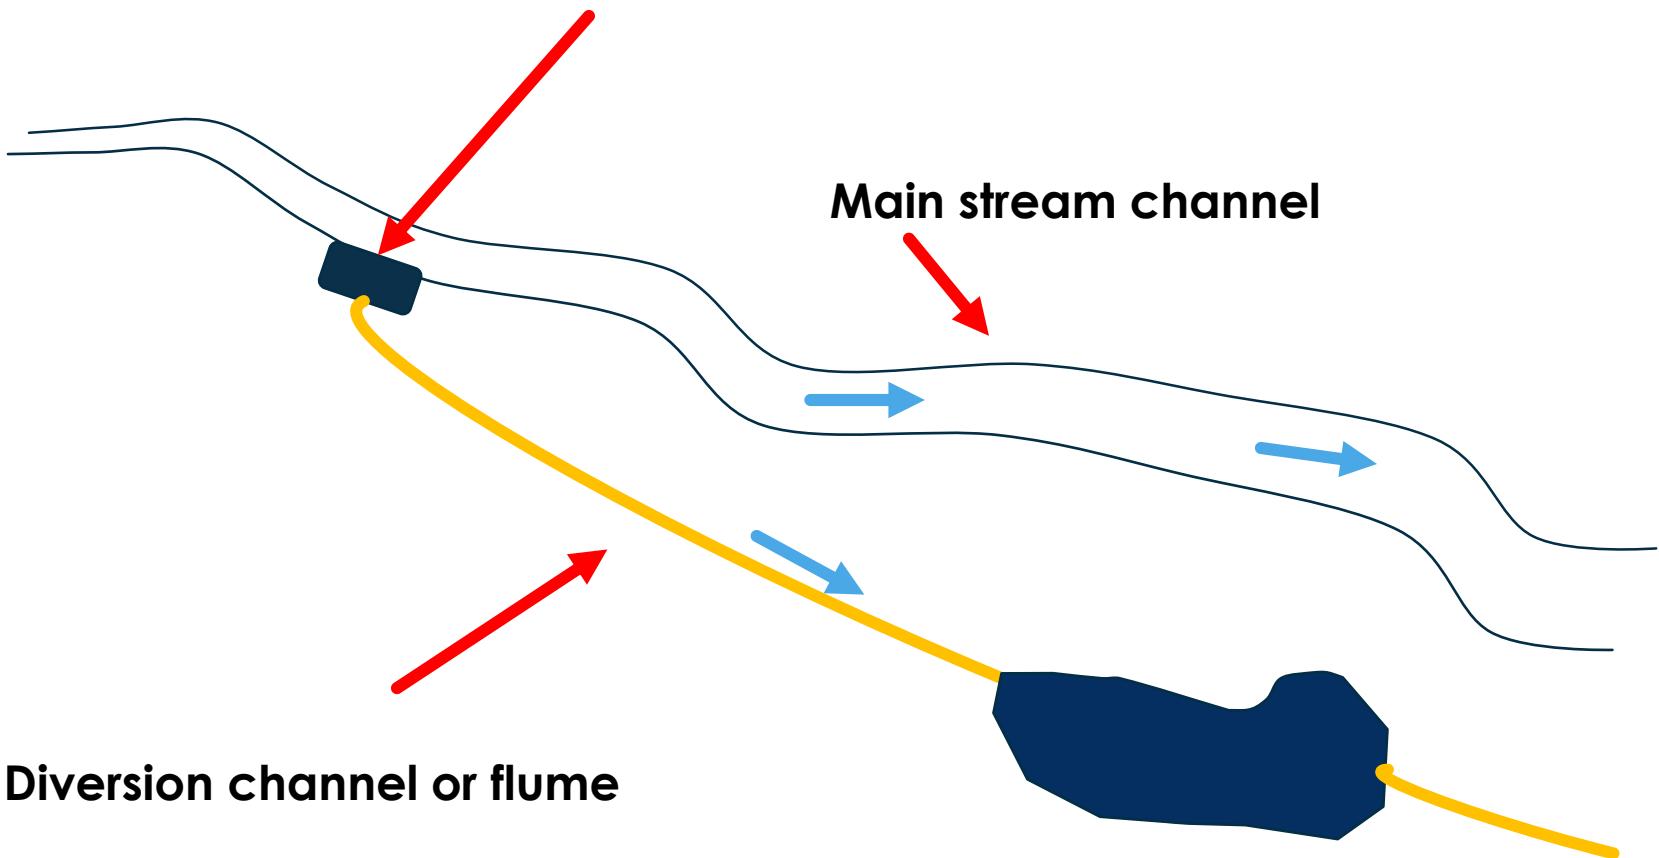

Higher reaches of the Englishman River watershed  
with elevations between 250 meters and 350 meters

Channel overflow structure on  
the side of the main stream

The existing creek or river  
channel would not be directly  
impacted

## Overflow diversion weir

Diversion channel or flume

The diversion channels carry water to fill constructed storage ponds / lakes

The ponds /lakes are constructed into the natural topography and are interconnected with naturalised streams and/or wetlands

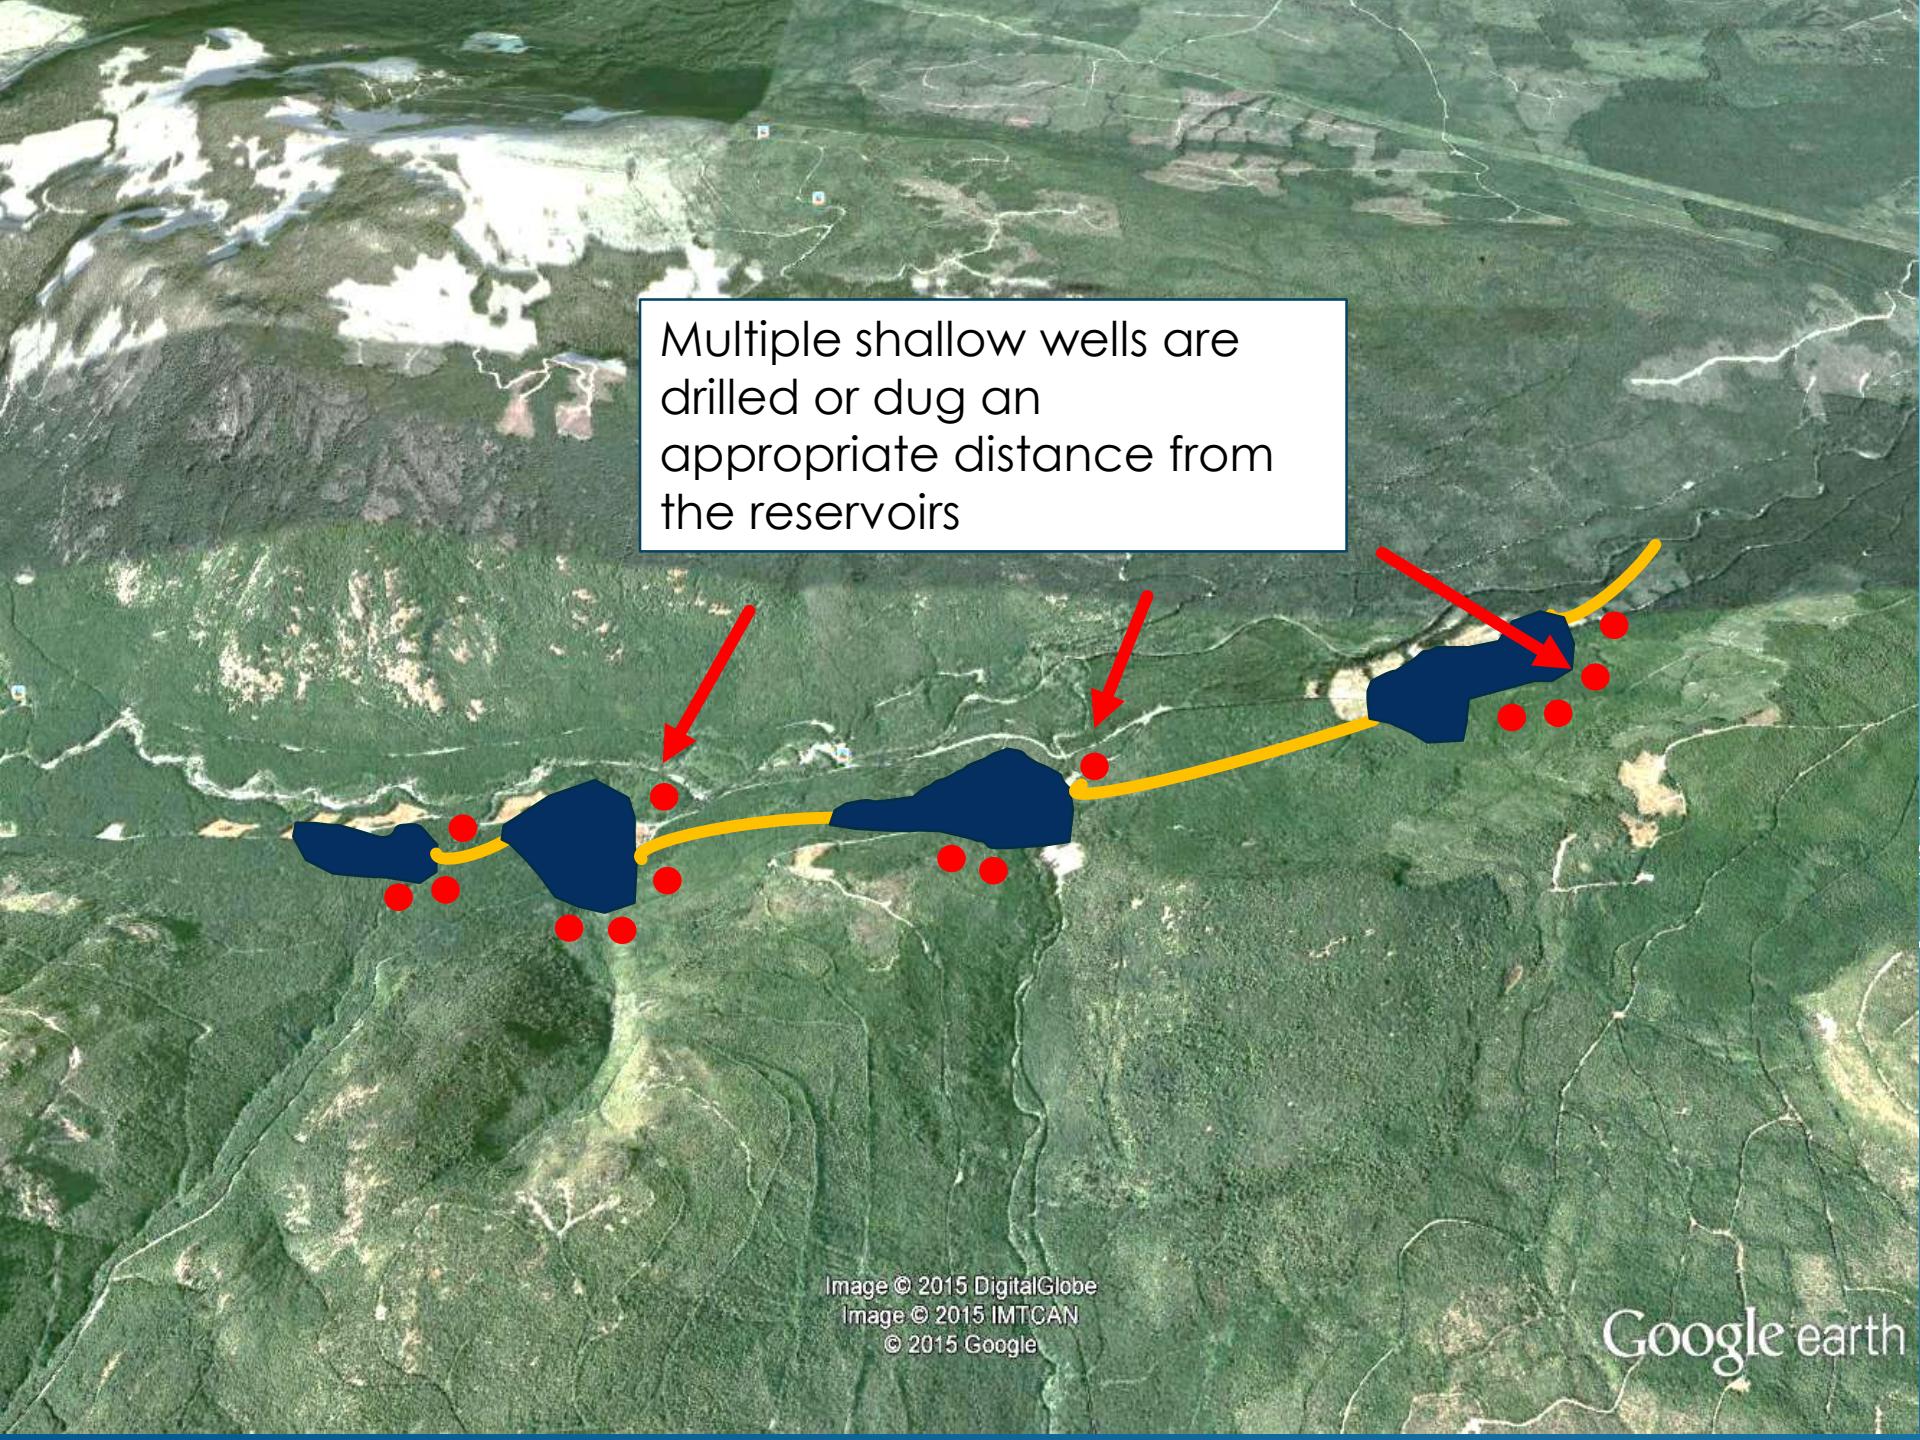

Many of the retention areas will receive inflow from surrounding land

The ponds/lakes can be vegetated with indigenous plants and trees.

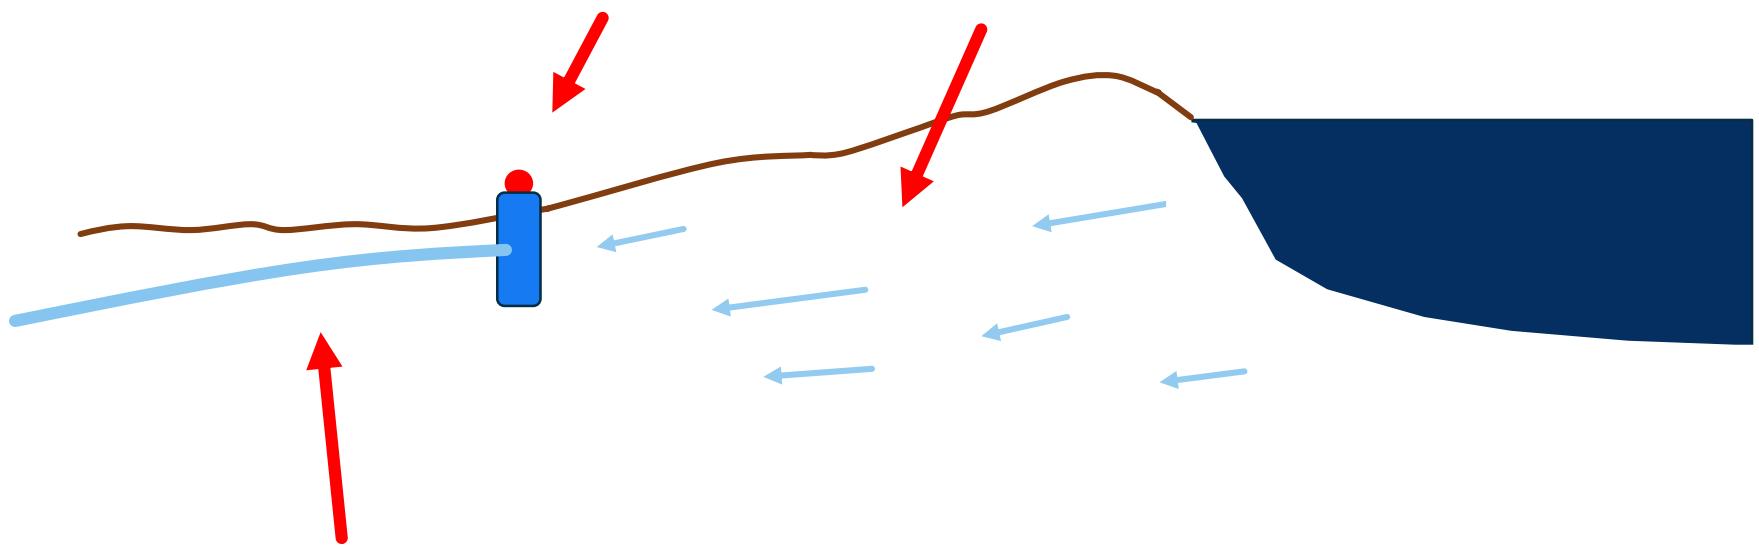

Overflow structures allow the fresh water to fill the ponds and the surplus to flow back to the stream

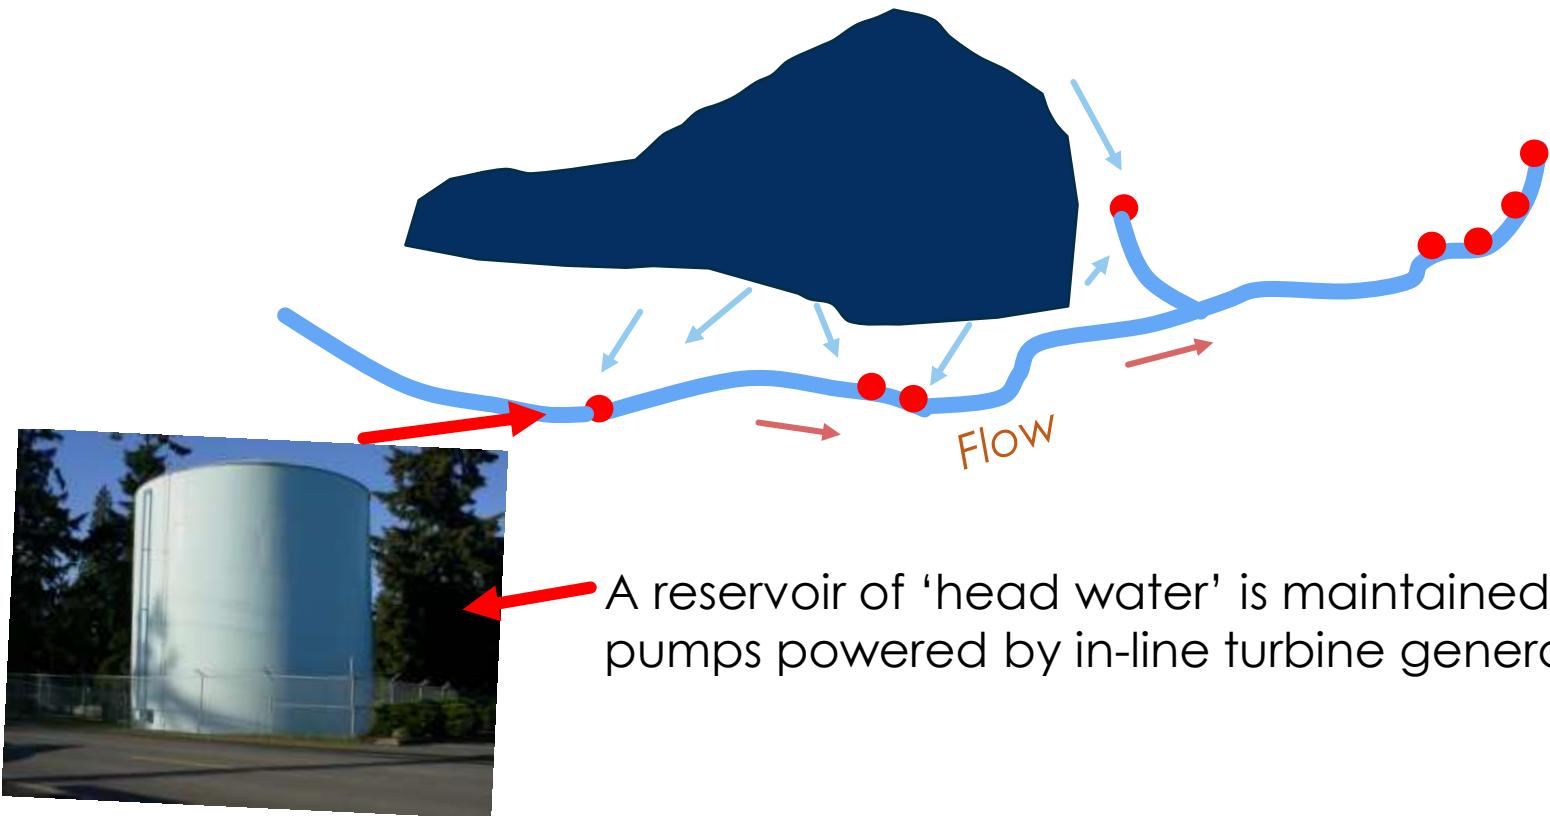

Multiple shallow wells are drilled or dug an appropriate distance from the reservoirs

The water from the reservoirs slowly infiltrates the surrounding land and recharges the groundwater for the wells.

The wells are inter-connected by small diameter siphon pipes, that carry the water downhill under pressure

The multiple siphon pipes are sized for continuous flow with remotely controlled valves downhill

Micro hydro in-line turbines could be installed anywhere in the downhill, pressure side of the supply system.

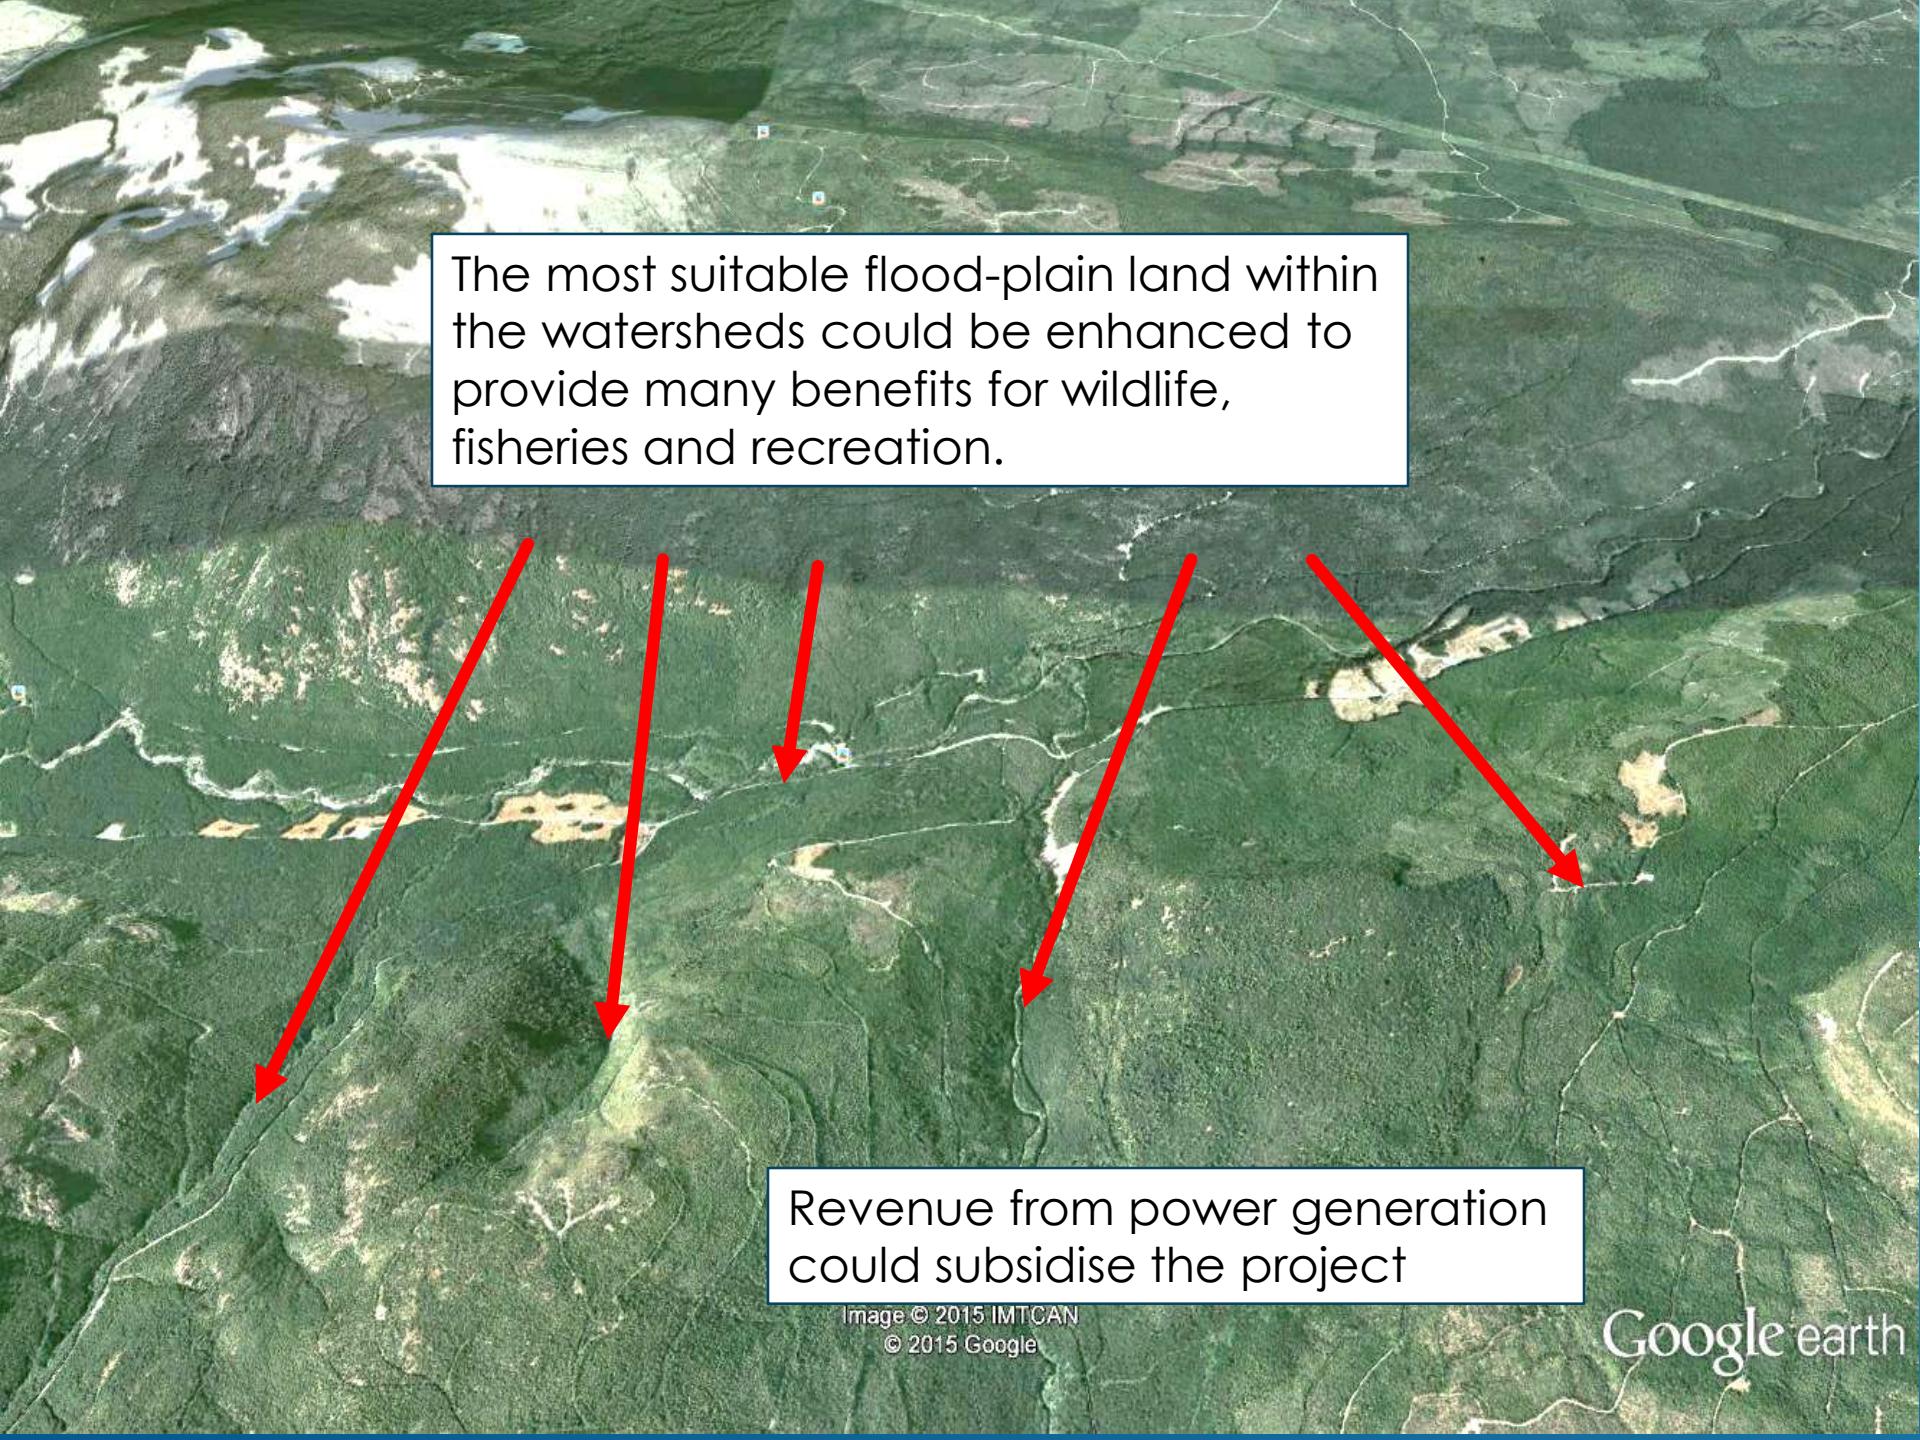

An advantage of multiple, small diameter, high pressure gravity lines, is that the source to delivery has many available options.

Data SIO, NOAA, U.S. Navy, NGA, GEBCO

Google earth

The most suitable flood-plain land within the watersheds could be enhanced to provide many benefits for wildlife, fisheries and recreation.

Revenue from power generation could subsidise the project

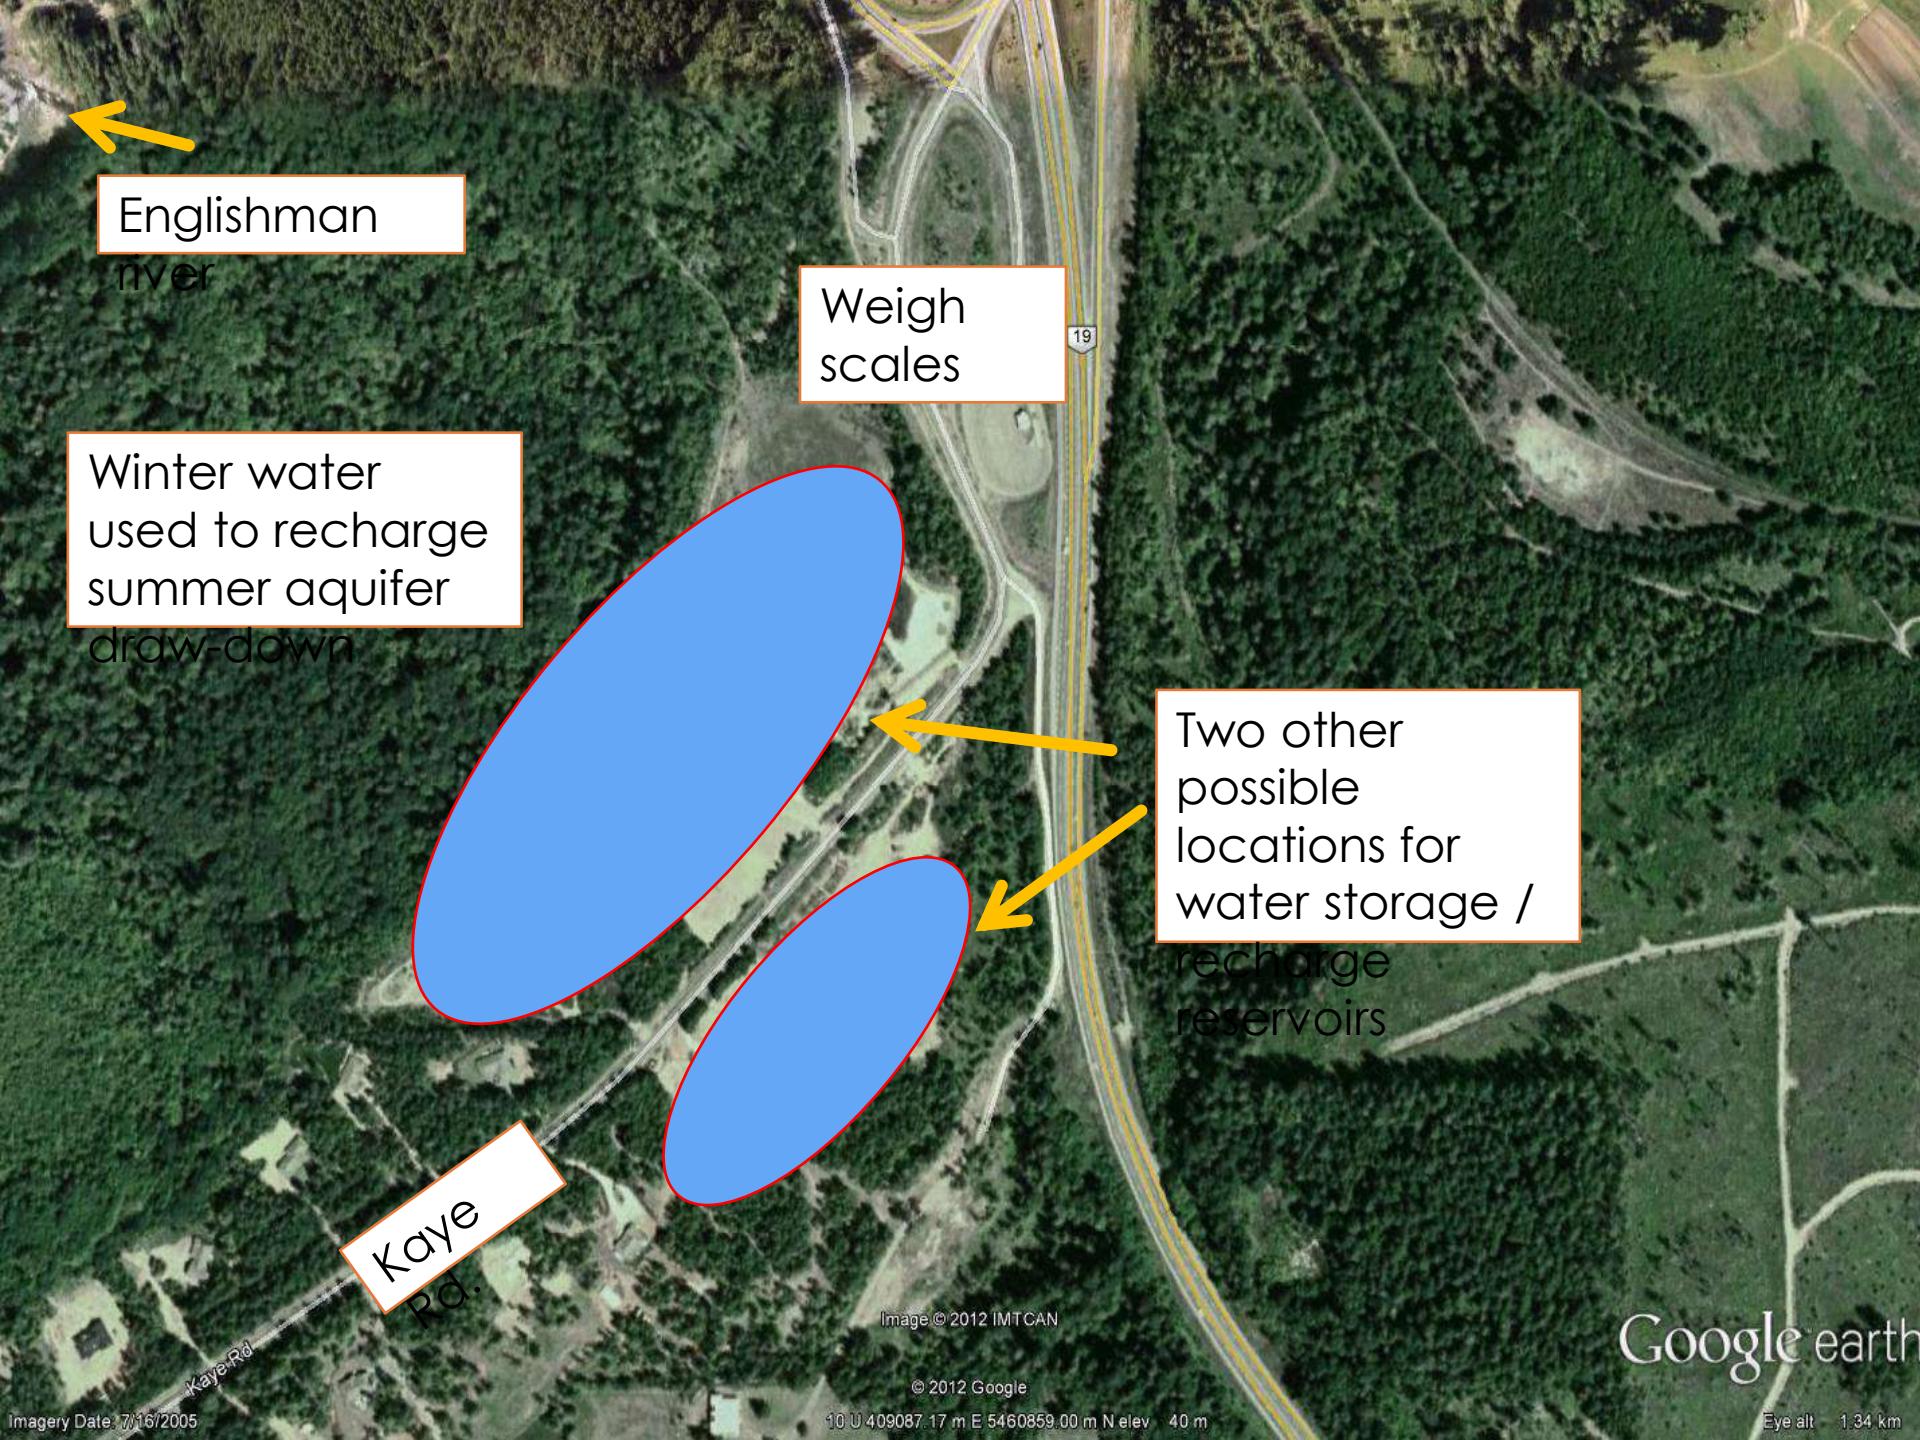

Many other options are possible for storage of surplus winter water

Two of the possible locations for water storage / recharge reservoirs

Google earth

Located in Washington Park these reservoirs hold about 130,000,000 litres of water

City of Portland Oregon has two sealed reservoirs to supply water to residents.

Does an underground stream exist that could help supplement the water supply?

## Another option

An underground stream of fresh water appears to flow into Craig Bay

Englishman River

This area would be a good location to drill a test well to evaluate the flow

Google earth

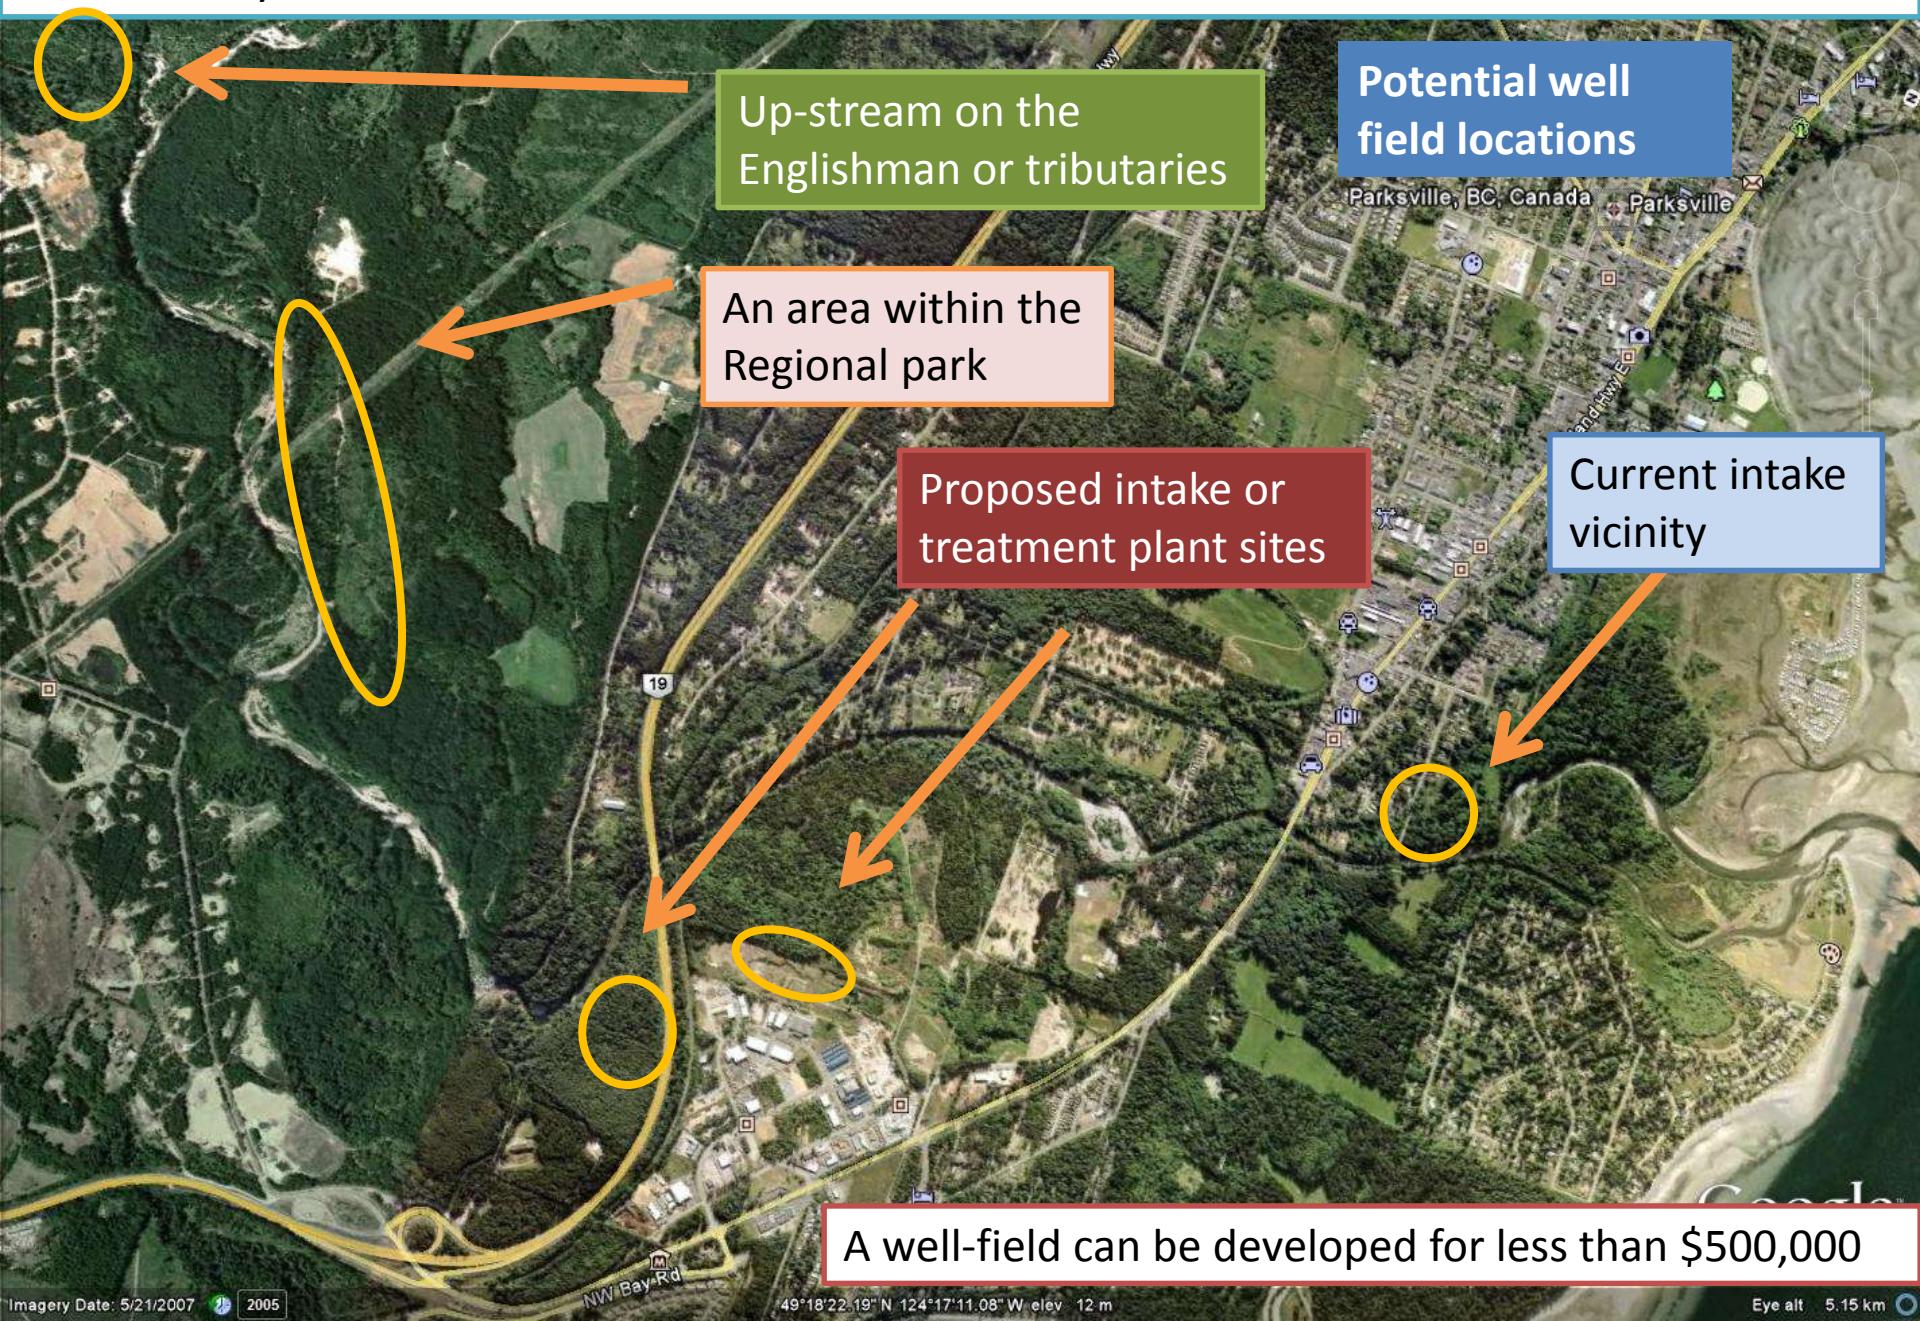

**Develop a well field/s upstream and in proximity to the Englishman River or a tributary?**

**The location and depth of the wells could eliminate the need for a full water treatment plant, as with San Pareil and Qualicum's river wells.**

**The cost of drilling a well \$12,000 – \$20,000  
10 inch main pipe \$26,000 per kilometre**

Potential sites for well-field development utilizing naturally filtered water to reduce or eliminate the necessity for water treatment other than disinfection.

**Encourage rainwater harvesting,  
storage and utilisation systems.**

## Drinking Water Free Refill Center 2002

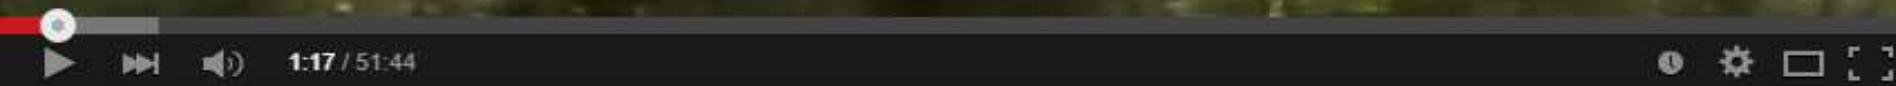

Pure drinking water,  
free of chemical  
disinfectant

# Troubled Water

Please check out this video By Paul Manly on YouTube.  
The segment relating to the Oceanside Area is after minute 24.

Contact your water supplier or the Vancouver Island Health Authority, if you have Questions or Concerns about your drinking water.

The background of the slide is a close-up photograph of a waterfall. The water is flowing over dark, textured rocks. In the upper right, several vertical icicles hang down. The surrounding environment includes some green moss and yellowish grasses. A white rectangular box is centered over the waterfall.

**Thank You**
